NOTES ON NURSING

BY FLORENCE NIGHTINGALE
Florence Nightingale
NOTES ON NURSING:

WHAT IT IS, AND WHAT IT IS NOT.

BY

FLORENCE NIGHTINGALE.

WITH SOME ACCOUNT OF HER LIFE.

BOSTON:
WILLIAM CARTER, 5 WATER STREET
1860.
The following notes are by no means intended as a rule of thought by which nurses can teach themselves to nurse, still less as a manual to teach nurses to nurse. They are meant simply to give hints for thought to women who have personal charge of the health of others. Every woman, or at least almost every woman, in England has, at one time or another of her life, charge of the personal health of somebody, whether child, or invalid,—in other words, every woman is a nurse. Every day sanitary knowledge, or the knowledge of nursing, or in other words, of how to put the constitution in such a state as that it will have no disease, or that it can recover from disease, takes a higher place. It is recognized as the knowledge which every one ought to have—distinct from medical knowledge, which only a profession can have.

If, then, every woman must at some time or other of her life, become a nurse, i.e., have charge of somebody's health, how immense and how valuable would be the produce of her united experience if every woman would think how to nurse!

I do not pretend to teach her how, I ask her to teach herself, and for this purpose I venture to give her some hints.

(iv)
FLORENCE NIGHTINGALE.

In the year 1820, in Florence, that lovely city,

"where earth and sky
Are picture both and poetry,"

was born the younger of the two daughters of William Shore Nightingale, Esq.; and, in memory of her birthplace, its beautiful name was given to her who will be known to all time as Florence Nightingale.

Her father, William Shore Nightingale, son of William Shore, Esq., of Tapton, is a descendant of the ancient Derbyshire family of Shore—of which Lord Teignmouth is the representative of another branch. He assumed the name of Nightingale by the Prince Regent's sign manual in 1815, in accordance with the will of his maternal uncle, Peter Nightingale, whose niece and sole heiress his father had married. In early life, in 1818, he married Frances, daughter of William Smith, Esq., formerly M. P. for Norwich, a zealous laborer in the cause of slave emancipation, and a benevolent, earnest man. By inheritance, Mr. Nightingale possessed large wealth, and the ample estates of Embley Park, Hampshire, and the Lea Hurst, Derbyshire.

The early youth of Florence Nightingale was passed under circumstances well calculated to foster an elegant mind and a tender heart. The child of affluent and intellectual parents, surrounded by all that is beautiful in nature and rich in art, and beloved by all who came in contact with her, her heart and mind developed their rare qualities together.

Under the guidance of her father, she attained considerable proficiency in the classics, and in mathematics—studies which are rarely pursued by ladies in these latter days. Nor were the more feminine accomplishments neglected by the ardent student. She became an excellent musician, and conversant with most of the modern languages, speaking French, Italian, and German with fluency and purity.

During the course of her studies she travelled extensively, visiting most of the cities of Europe, and penetrating even to the remotest cataract of the Nile. While in Egypt, it is said, she tended the sick Arabs with whom she came in contact, and frequently, by judicious counsel and advice, rendered them important services.

The favorite home of Miss Nightingale's childhood—Lea Hurst, Derbyshire—is a most picturesque and romantic spot. The quiet and secluded hamlet of Lea abounds in lovely scenery, and in interesting historical and literary associations. Lea Hurst is beautifully situated on rising ground, "in one of the most charming and extensive of the Derbyshire valleys, and surrounded with hills and mountains, rocks and woods, of majestic and gigantic proportions, and watered by the winding Derwent and its tributary streams."

From her earliest childhood, Florence Nightingale displayed a constant and active sympathy with the suffering, the desolate, and the distressed among the poor around Lea Hurst and Embley. As a friend, a benefactress and a consoler, she was daily welcomed in many a cottage; and to the alleviation of pains and sorrows she devoted her personal energies and her large fortune. She was for many years, as a voluntary teacher, the principal support of the schools for the poor in the neighboring villages; for she never wearied of well-doing.
Having attained the age when young ladies of birth and fortune generally "come out" and partake of the brilliant gayeties of society, Florence Nightingale visited London. But it was for the purpose of frequenting and studying the hospitals, schools and reformatory institutions of the metropolis, a self-imposed duty, which she performed with untiring energy and diligence. Yet she did not neglect to fulfil the more immediate duties of her station with grace and propriety, even to a presentation at Court; which proved that she was not one of those who devote themselves to the cause of charity in order to avoid the onerous claims of social life.

From London, Florence Nightingale went to Edinburgh, and to the Continent, intent on perfecting herself for a high and holy mission, and gathering up stores of knowledge for present as well as for future use. In the memorable year 1851, when all Europe held festive holiday in honor of the Great Exhibition, when "the highlands of Scotland, the lakes of Switzerland, and all the bright spots of the Continent were filled with parties of pleasure," Miss Nightingale — so well fitted by birth and education to shine a star in her own proper sphere — took up her abode in a hospital at Kaiserwerth on the Rhine, where Protestant Sisters of Mercy are trained as nurses for the sick; and for three long months, within the walls of this institution, she remained in daily and nightly attendance, unwearingly expending her health and strength in the cause of benevolence. Here she made herself thoroughly acquainted with all the rules and regulations required in the management of a hospital. The Pasteur Flieaner, director of the establishment, affirmed that during the progress of the institution, no one had ever passed so distinguished an examination or shown herself so thoroughly mistress of all she had to learn, as the young, wealthy, and graceful Englishwoman. With the institution she was so favorably impressed that she afterwards returned to it, and subsequently published a little book containing an account of its origin and management.

From Germany, Miss Nightingale returned to the happiness of home, the love of her parents and sister, and to the fresh, free air of Derbyshire and Hampshire, in order to recruit her health. But her sympathy and energy were speedily enlisted on behalf of the Hospital for Sick Governesses, established in Harley Street, London, which was languishing for want of proper management and judicious support. She was appealed to for aid. Most young and wealthy ladies in such a case would have given a handsome donation to assist the institution. With the heroism of pure benevolence Florence Nightingale gave herself.

She took the active and entire superintendence of the Sanatorium, devoting herself with indefatigable energy to place it on a firm basis. Derbyshire and Hampshire were exchanged for the narrow, dreary establishment in Harley Street, to which she devoted all her time and fortune. "While her friends missed her at assemblies, lectures, concerts, exhibitions, and all the entertainments for taste and intellect with which London, in its season, abounds," says one writer, "she, whose powers could have best appreciated them, was sitting beside the bed, and soothing the last complaints of some poor, dying, homeless, querulous governess. The homelessness might, not improbably, result from that very querulous-ness; but this is too frequently fostered, if not created, by the hard, unreflecting folly which regards fellow-creatures intrusted with forming the minds and dispositions of its children
as ingenious, disagreeable machines, needing, like the steam-engine, sustenance and covering, but, like it, quite beyond or beneath all sympathy, passions, or affections. Miss Nightingale thought otherwise, and found pleasure in tending those poor, destitute governesses, in their infirmities, their deaths, or their recoveries. She was seldom seen outside the walls of the institution, and the few friends whom she admitted found her in the midst of nurses, letters, prescriptions, accounts, and interruptions. Her health sank under the heavy pressure, but a little Hampshire fresh air restored her, and the failing institution was saved.

About this time, 1854, Florence Nightingale also took an active interest in the Ragged Training Schools, and several similar institutions. She felt, with Hannah More, that "the care of the poor is the profession of women," and all her talents were unceasingly employed in the amelioration of their miseries.

But while Miss Nightingale was recruiting her health and spirits in her beautiful home at Embley, a cry of dire distress and bitterest agony came from the East, piercing England nearly to the heart. It arose from our wounded brethren, huddled together, languishing in their rough beds, destitute of comforts or even necessary accommodations, crushed by the cold, unfeeling, iron heel of Routine, and by the heavy, murderous hand of Mismanagement. An enthusiastic desire to respond to it instantly sprang up in the breasts of all who heard it; and suggestions were offered from all quarters by warm and willing hearts. Undisciplined zeal, however, could do little towards supplying the wants of those dying heroes who were uttering the mournful cry for help; and it was feared lest the ardent feelings which had been roused might flag or be misdirected for lack of some systematic arrangement. Wealth was poured forth to aid, and food, clothing, medicines, and other necessaries were shipped in abundance; but something more was needed. A proposition, originated by Lady Maria Forester, to form a band of female nurses, to be despatched to the seat of war, was started, and found favor with the government and the majority of the public.

The idea being propounded, the chief difficulty was to carry it out; and there was a fear "lest a noble impulse should fail for the want of a head, a hand, and a heart to direct it." But, having engaged three nurses, Lady Maria Forester waited on Miss Nightingale, and entreated her to take the direction and entire control of the nursing establishment for our sick and wounded soldiers and sailors on the distant shores of the Levant. Lady Maria's request, earnestly seconded by that of the Right Hon. Sidney Herbert, then secretary-at-war, induced Miss Nightingale to yield a generous consent to undertake the management of the expedition. It is, indeed, affirmed by some, that, by a strange coincidence, the noble woman had herself written to Mr. Herbert on the very same day, volunteering her services where they were so direfully needed.

Immediately on her intention becoming known, horror thrilled the souls of those humane and wise Gradgrinds who, comprehending no "facts," but those which had undoubted precedents, had laughed aloud when Elizabeth Fry proposed to cleanse Newgate, and had coldly sneered when Hannah More hinted at Sunday schools. But, upheld by her noble and compassionate heart, and resolved to follow humbly and reverentially in the footsteps of One who had suffered from evil tongues, Florence Nightingale calmly held on her way up the steep and rocky road, nor heeded the discordant cries which would have called her back.
Not a moment was lost in unnecessary delay, or in preliminary preparations. Miss Nightingale formed, from some hundreds who offered, a band of thirty-seven nurses—many of them, like herself, volunteers from the higher ranks of life, gentle ladies, accustomed to ease and luxury, but not unused to tend the suffering or the dying, nor to lead lives of charity and self-denial. Twelve nuns from the Convent at Norwood, under charge of their superioress, an Irish lady, proffered their services, and were gladly included in the noble corps; for the holy leader of the band was no narrow-minded bigot, and did not doubt but that a basin of gruel, a glass of wine, or a cup of medicine, might perhaps be administered as tenderly by a hand which clasped a missal as by one which touched a Testament. When every thing was ready, Florence Nightingale bade farewell to her fond parents and her affectionate sister, renounced her friendships and her intellectual pleasures, and quitted the comforts of her home, the quiet liberty of dear old England, for a perilous journey to a land teeming with danger and disease.

She and her sister-laborers, prompted by the most sincere, charitable, and religious feelings which can inspire the human heart, and undaunted by the length of the voyage, the strange and distant country before them, the awful scenes they would encounter, or the privations they would have to endure, started for their destination on Tuesday, the 24th of October, 1854. Surely, if there was heroism in dashing up the heights of Alma, seeking glory at the cannon's mouth in defiance of death and of all mortal opposition, amid the shouts of the victors and the cries of the vanquished, there was heroism unparalleled in calmly volunteering to minister to the fever-stricken and the dying in a place reeking with deadly disease and polluted air, where "wounds almost refused to heal, and where the heavy smell of pestilence could be perceived outside the very walls," and surrounded by sights and sounds calculated to appall the stoutest hearts.

They were accompanied by Mr. and Mrs. Bracebridge, a clergyman, and a courier. On their arrival at Boulogne, the self-devoted band was hailed with demonstrations of sympathy and respect by a crowd which assembled to welcome them on their way, and bid them "God speed." In passing through France, they were received with the utmost enthusiasm; hotel-keepers refusing payment for their accommodation, servants declining the customary fees, all emulating to evince admiration and sympathy. One of the Paris journals, on Miss Nightingale's passing through the French metropolis, observed of her that "her toilette was charming, and she was almost as graceful as a Parisienne." On the 27th, they sailed from Marseilles, in the Vectis steamer, for Constantinople.

On the 5th of November, Miss Nightingale, accompanied by Mr. and Mrs. Bracebridge, and her nurses, arrived at Constantinople; and the whole party was speedily established at their new quarters in the Barrack Hospital at Scutari. This was a handsome building, capable of holding an immense number of soldiers; the court-yard alone being sufficiently large to afford space for exercising twelve thousand men, and the corridors, running the whole length of the barrack, being estimated to comprise four miles in extent. On three sides of the building were galleries, in which were ranged in double rows the beds of the patients. Five rooms, which had been set apart for wounded general officers, were happily vacant; and these were assigned to Miss Nightingale and her friends.
The appearance of the delicate, tender, thoughtful nurses was hailed with delight and raptures of gratitude by the objects of their sympathy and devotion. One poor fellow burst into tears, and exclaimed, "I can't help crying when I see them. Only think of Englishwomen coming out here to nurse us; it is so homely and comfortable!" The heavy cares and duties which awaited them were terribly increased, within a few hours of their coming, by the arrival of six hundred wounded, sent down after the battle of Inkerman. The over-worked surgeons, "one and all," acknowledged that their services, at such a juncture, were invaluable; even the most "hard-headed old Scotch surgeons," whom some of the croakers had feared would be constantly resenting raps from the scented fan of Miss Nightingale, admitted that the tender nurses "were not in the way except to do good."

"Miss Nightingale," says one letter, in November, "appears eminently qualified for the noble work she has undertaken. Her labors will spare the clergy many a sad sight of men sinking for want of proper nursing, and because food cannot be administered often enough. This is impossible, with only the hospital orderlies; but with the nurses, all who need will be supplied." But food, clothing, medicines, and extra medical aid were wanting; and the men were constantly sinking through exhaustion, when, if it had been at hand, a timely stir ululant administered might have saved them.

Linen, flannels, stockings, and other necessary articles of clothing, were not to be obtained; the vast freight which had been sent from England were either rotting under the snow at Balaklava, or hidden in the mud outside the custom-house at Constantinople. The strength with which Miss Nightingale supported the difficulties and duties of her position surpassed even the expectations of those who were best acquainted with her character and the resources of her nature. Every day brought some new complication of misery to be unravelled. "Each day," observes a qualified witness, "had its own peculiar trial to one who had taken such a load of responsibility in an uncried field, and with a staff of her own sex all new to it. She has frequently been known to stand twenty hours, on the arrival of fresh detachments of sick, apportioning quarters, distributing stores, directing the labors of her corps, assisting at the most painful operations where her presence might soothe or support, and spending hours over men dying of cholera or fever. Indeed, the more awful to every sense any particular case might be, the more certainly might be seen her slight form bending over him, administering to his ease by every means in her power, and seldom quitting his side until death released him."

Yet the difficulties of Florence Nightingale's position were increased tenfold by the continual struggles which she was obliged to undergo with System and the prejudices of individuals. By petty, daily contests, she was compelled to extort from the authorities a scanty allowance of the necessary materials required by her and her band of nurses. Etiquette and "service" regulations impeded her movements at every step; "indolence, indifference, and incapacity" combined to clog her exertions; for "no one would take responsibility upon himself, even to save the lives of hundreds." Happily, the presence and able cooperation of Mr. Macdonald, the distributor of "The Times Fund," enabled her at length to lay in stores, to institute proper culinary and washing departments, and to introduce some order and comfort. Had it not been for their mutual exertions, a large proportion of the poor prostrate sufferers must have been condemned to wear the tattered,
filthy rags, in which they were brought down from the Crimea. A washing contract had, it is true, existed; but it was totally inoperative, and the beds and habiliments of the men had been in a condition loathsome and foul beyond description. A house, well supplied with water, close to the Barrack Hospital, was engaged at the charge of the fund, and here the clothing supplied by Miss Nightingale was washed and dried. In ten days after her arrival an impromptu kitchen was fitted up, from which eight hundred men were daily supplied with well-cooked food and other necessary culinary comforts in abundance—beef-tea, chicken-broth, rice-pudding, jelly, chickens, and numerous delicacies. Heretofore the cookery, performed by soldiers, without any superintendence, and of course without any system, had been most detestable, when the sickly, fastidious appetite of a fevered or consumptive patient is considered. Meat and vegetables had been boiled in one large copper, the separate portions enclosed in nets, and served up either done to rags or half raw; and the delivery had been as devoid of system as the cookery. Sometimes it would be six or seven o'clock in the evening before, in individual cases, things ordered could be supplied, and then the means of cooking would be at an end. In subordinate as well as in leading points of arrangement, the same feminine, directing hand was now to be traced.

With rare thoughtfulness, the nurses were employed in making up needful articles of bedding or surgical requisites, stump pillows for amputation cases, and other things of a like nature.

One "rule of the service" was in existence which alone exemplifies the system bearing so heavily upon the helpless invalids, and which it required all the tact and firmness of Miss Nightingale to stand against; it demanded that all articles needed even for present use should be procured from home through the commissariat; and there was likewise a regulation appointing that a "board" must judge stores already landed, before they could be given out. On one occasion, the "board" not having completed its arrangements, and the men languishing for the stores sent from England, Miss Nightingale insisted that they should be at once dispensed. Red Tape, shocked at the audacity of such a singular proposition, interposed; woe betide the man amenable to martial law who should dare to touch even the cordage of one box! The noble-spirited woman, conscious that determination must effect what entreaty had failed to do, had the store-house broken open, on her own responsibility, and its contents distributed through their proper channels. But, on all other occasions, she paid the most scrupulous deference to the existing laws. Her name and angelic ministerings were the theme of frequent grateful praise among the men in the trenches; and it was remarked that she made the Barrack Hospital so comfortable, that the convalescents began to display a decided reluctance to leave it.

Not only in the scene of her arduous labors, but at home, was the self-dedicated Samaritan assailed by jealousies and suspicions. The circumstance of her having accepted the services of some Sisters of Charity from the nunnery at Norwood, and from St. Stephen's Hospital, Dublin, drew down upon her, in December, so invidious an attack from a clergyman of the Established Church, that the Hon Mrs. Sidney Herbert was obliged to step forward and defend her absent friend, and show "how cruel and unjust" were the aspersions thrown upon her.

"It is melancholy to think," she wrote to the wife of the Rev. gentleman, "that in England no one can undertake any thing without the
FLORENCE NIGHTINGALE.

most uncharitable and sectarian attacks; and, had you not told me, I should scarcely have believed that a clergyman of the Established Church would have been the mouthpiece of slander. Miss Nightingale is a member of the Established Church of England, and what is called rather Low Church."

The Hon. and Rev. Sydney Godolphin Osborne adds his testimony to the pure religion of the object of these animadversions: "I found her myself to be, in her every word and action, a Christian; I thought this quite enough. It would have been, in my opinion, the most cruel impertinence to scrutinize her words and acts to discover to which of the many bodies of true Christians she belonged. I have conversed with her several times on the deaths of those whom I had visited ministerially in the hospitals, with whom she had been when they died. I never heard one word from her lips that would not have been just what I should have expected from the lips of those whom I have known to be the most experienced and devout of our common faith. Her work ought to answer for her faith; at least, none should dare to call that faith in question, in opposition to such work, on grounds so weak and trivial as those I have seen urged. . . . If there is blame in looking for a Roman Catholic priest to attend a dying Romanist, let me share it with her — I did it again and again."

Early in January, 1855, the executive strength at Miss Nightingale's disposal was increased by the arrival of Miss Stanley, with fifty more nurses, who were terribly needed, for there were then on the Bosphorus and Dardanelles no less than eight hospitals, containing an aggregate of nearly five thousand sick and wounded, while there were eleven hundred more on their way from the Crimea. In the Barrack Hospital alone there were about three thousand patients, all of them severe cases.

But as Florence Nightingale was struggling against the disgraceful jealousy of hospital officials, her heart was cheered and encouraged by a glorious letter, filled with true English warmth and sympathy, written by Queen Victoria — "not a letter stiff with gold thread and glittering with gems," but womanly and queen-like, "with nothing of the ermine about it but its softness and purity."

"Would you tell Mrs. Herbert," wrote the Queen of England to Mr. Sidney Herbert, "that I beg she would let me see frequently the accounts she receives from Miss Nightingale or Mrs. Bracebridge; as I hear no details of the wounded, though I see so many from officers, &c., about the battle-field, and naturally the former must interest me more than any one. Let Mrs. Herbert also know that I wish Miss Nightingale and the ladies would tell these poor, noble, wounded and sick men that no one takes a warmer interest, or feels more for their sufferings, or admires their courage and heroism more than their Queen. Day and night she thinks of her beloved troops. So does the Prince. Beg Mrs. Herbert to communicate these my words to those ladies, as I know that our sympathy is much valued by these noble fellows."

It is easy to imagine that this letter, so gracious, kind, and tender, must have strengthened the heart of the noble Florence Nightingale in her arduous work. Touching and simple, those words of sympathy, "spoken right nobly as a queen, right affectionately as a mother, right eloquently as a woman," are worth a thousand times the brave speeches or heroism of any of the queens of "the jewel set in a golden sea." But Her Majesty has proved by many good deeds that she can feel for suffering and want, and has always evinced more especially a strong
FLORENCE NIGHTINGALE.

interest in her wounded or disabled soldiers, visiting and cheering them on many occasions.

By February, the great increase of fever was the chief point of remark; it raged destructively, and in less than a month it swept away no fewer than seven surgeons, leaving eight more, and three of the nurses, dangerously ill. Indeed, at that time there was but one medical attendant well enough to wait on the sick in the Barrack Hospital; and his services were required in no less than twenty-one wards. Drs. Newton and Struthers were tended in their last moments, and had their dying eyes closed, by Miss Nightingale. For "wherever there is disease in its most dangerous form," wrote Mr. Macdonald, in February, "and the hand of the despoiler distressingly nigh, there is that incomparable woman sure to be seen; her benignant presence is an influence for good comfort, even amid the struggles of expiring nature. She is ‘a ministering angel,’ without any exaggeration, in these hospitals; and, as her slender form glides quietly along each corridor, every poor fellow's face softens with gratitude at the sight of her. When all the medical officers have retired for the night, and silence and darkness have settled down upon those miles of prostrate sick, she may be observed alone, with a little lamp in her hand, making her solitary rounds. The popular instinct was not mistaken which, when she set out from England on her mission of mercy, hailed her as a heroine; I trust that she may not earn her title to a higher, though sadder, appellation. No one who has observed her fragile figure and delicate health can avoid misgivings lest she should fail. With the heart of a true woman, and the manners of a lady, accomplished and refined beyond most of her sex, she combines a surprising calmness of judgment with promptitude and decision of character."

Of the sublime courage which must have supported her during these solitary nocturnal rounds we may judge by the slight sketch given in another place. Speaking of the frightful and sickening sounds and sights in the wards and corridors, he says: "During the day little of this is heard; but when all is silent, and sleep has settled down upon the occupants of each ward and corridor, then rise at intervals upon the ear sounds which go straight to the heart of the listener."

Merely to see her pass along was an inexpressible comfort to the men. "She would speak to one," said a poor fellow, writing home, "and nod and smile to a many more; but she couldn't do it to all, you know. We lay there by hundreds; but we could kiss her shadow as it fell, and lay our heads on the pillow again, content." In her rounds, to one she would administer words of consolation and hope, to another teach resignation, now cheering with a smile or sympathizing with a sigh — ministering to the necessities both of mind and body of the sufferers, who, following her light, soft footsteps with their tear-brimmed eyes, bent to "kiss her shadow as it fell." Such was her influence, that when men, frenzied by their wounds and disease, had worked themselves into a passionate refusal to submit to necessary operations, a few calm sentences of hers seemed at once to assuage the storm; and the men would submit willingly to the painful ordeal they had to undergo.

Of Florence Nightingale's personal appearance the author of "Scutari and its Hospitals" gives a most interesting description. "Miss Nightingale," he says, "is just what you would expect in any other well-bred woman, who may have seen, perhaps, rather more than thirty years of life; her manner and countenance are prepossessing,
and this without the possession of positive beauty; it is a face not easily forgotten, — pleasing in its smile, with an eye betokening great self-possession, and giving, when she wishes, a quiet look of firm determination to every feature. Her general demeanor is quiet, and rather reserved; still, I am much mistaken if she is not gifted with a very lively sense of the ridiculous. In conversation, she speaks on matters of business with a grave earnestness I should not expect from her appearance. She has evidently a mind disciplined to restrain, under the principles of the action of the moment, every feeling which would interfere with it. She has trained herself to command, and learned the value of conciliation towards others, and constraint over herself. She seems to understand business thoroughly. Her nerve is wonderful. I have been with her at very severe operations; she was more than equal to the trial."

In April Miss Nightingale lost a very dear personal friend, one of the nurses, a young and amiable lady named Miss Smythe. This lady had commenced her occupation as nurse at Scutari, but, being requested to join Miss Bracebridge at Kululce, — which was on the Asiatic side of the Bosphorus, five miles from Scutari, — she left for that place, much regretted by Miss Nightingale, who said she hoped that they would have labored together in the same hospital. Shortly after her arrival she was attacked by fever, and died deeply mourned. Miss Nightingale's firm, systematic, and energetic thoughtfulness at length gained its way, and she had the satisfaction of seeing that the most important part of her work at Scutari was accomplished. She accordingly repaired to Balaklava, with the view of inspecting its hospitals, arriving there May 4, 1855. There she examined the general state of affairs, had new huts erected, kitchens built, and vigorous organization instituted; but no sooner were all these matters arranged than the long-continued arduous exertions which she had undergone told on her system. Her delicate and fragile frame was attacked by Crimean fever; and, completely prostrated, she was carried up to the hut-hospital on the heights.

For a fortnight the fever continued its hold; but at the end of that time Florence Nightingale rose, weak, yet pronounced out of danger, from her sick bed. She was earnestly entreated to return to England; but no persuasion could induce her to quit her post, or to proceed further than Scutari. Too well she knew that her presence on that sad spot was still urgently needed. She left Balaklava for Scutari, June 6; Lord Ward placing his steam yacht at her disposal, that she might have the advantage of change of air in sea excursions to recruit her strength. So exhausted was she that she had to be carried down to the vessel, tenderly and reverently in the arms of the men, amidst their heartfelt prayers for her speedy recovery. Miss Nightingale's efforts for the poor fellows in the hospitals did not terminate with their death; for on her return to Scutari she originated a scheme for erecting a monument to the brave men who had died during the winter. This memorial has been only recently completed, and now towers in gloomy grandeur above the surrounding graves of our British heroes. It is simple and massive; a square base, surmounted by four figures of angels with drooping wings, who support a tapering shaft, which rises towards the sky. In four different languages on each side of the base is this inscription:

"This Monument was erected by Queen Victoria and her People."
FLORENCE NIGHTINGALE.

By December, 1855, the greater number of the hospitals were closed; the Barrack Hospital was again used for its original purpose; and all seemed hopeful and invigorated. Her Majesty, to mark her warm appreciation of the inestimable services of Miss Nightingale, presented her with a beautiful ornament, adapted to be worn as a decoration of the most elegant and costly description. It was formed of a St. George's Cross, in ruby-red enamel, on a white field, representing England; this was encircled by a black band, typifying the office of charity, on which was inscribed the legend, "Blessed are the merciful." The letters V. R., surmounted by a crown in diamonds, were impressed upon the centre of the St. George's Cross, from which emanated rays of gold. Wide-spreading branches of palm, in bright-green enamel, tipped with gold, composed a framework for the shield, their stems being banded with a ribbon of blue enamel, inscribed with the word "Crimea." At the top three brilliant stars of diamonds illustrated the idea of the light of heaven shed upon labors of mercy, peace, and charity. On the back of the jewel there was an inscription written by Her Majesty, recording it to be a gift in memory of services rendered to her brave army by Miss Nightingale. The ornament was about three inches in depth by two and a half in width. This gift was accompanied by an autograph letter full of deep feeling, and graceful, queenly kindness.

The sultan also presented Miss Nightingale with a superb bracelet, set in brilliants, as "a mark of his estimation of her devotion."

At the close of 1855 it was resolved that an acceptable testimonial of public gratitude should be offered to the generous Florence Nightingale; and a "Nightingale fund" was immediately raised. But, as the noble-hearted woman distinctly declined any purely personal reward for her efforts, a resolution was passed at a meeting held in Willis's Rooms, in December, that the fund raised should be invested to establish "an institute for training, sustenance, and protection of nurses and hospital attendants," to embrace the paid and the unpaid, for whom a home was to be provided, and a retreat for old age. Numerous meetings were held, over some of which presided a prince of the blood royal, who had been a witness of Miss Nightingale's labors in the East, and which were attended by men of the highest and noblest reputation. One important meeting was held at the Mansion House, December 26, at which the lord mayor presided, and at which the names of many of the most influential merchants, traders, and manufacturers were announced as having consented to become members of a committee. A copy of the proceedings of the meeting at Willis's Rooms was sent out to Miss Nightingale; to this she returned, in January, 1856, a letter most characteristic of her firm, practical, and yet gracious, kindly disposition. "Exposed as I am," she says, "to be misinterpreted and misunderstood, in a field of action in which the work is new, complicated, and distant from many who sit in judgment on it, it is, indeed, an abiding support to have such sympathy and such appreciation brought home to me in the midst of labors and difficulties all but overpowering. I must add, however, that my present work is such as I would never desert for any other, so long as I see room to believe that what I may do here is unfinished. May I, then, beg you (Mrs. Herbert) to express to the committee that I accept their proposal, provided I may do so on their understanding of this great uncertainty, as to when it will be possible for me to carry it out." This gift of gratitude was, in very truth, but giving its recip-
FLORENCE NIGHTINGALE.

ient more work to execute; yet, as her friend Mr. Sidney Herbert observed, "Miss Nightingale looks to her reward from this country in having a fresh field for her labors, and means of extending the good that she has already begun. A compliment cannot be paid dearer to her heart than in giving her more work to do."

In March, 1856, Miss Nightingale sustained a slight injury from the upsetting of a vehicle, in which, with some of the nurses, she was proceeding up to the front of Balaklava. Her back being hurt, she was obliged to remain for a short time in the Castle Hospital, which had been erected during the summer of 1855, in a lonely but healthy spot at the mouth of Balaklava Harbor. During the spring, despite her anxieties and responsibilities, she found time to attend to different minor affairs; through her exertions, "a considerable quantity of school materials, such as maps and slates, was supplied to the schools;" she advanced on her own responsibility a sufficient sum from "The Times Fund" to complete the erection of the Inkerman Café; she aided the active senior chaplain in establishing a library and schoolroom, and warmly assisted him in organizing evening lectures for the men. She took a kindly interest in the private affairs of the men, and forwarded their savings to their families in England, at a time when there was no provision for sending home small sums; she wrote letters for the sick; she studied the comforts of those who were convalescent; and from the dying she took charge of bequests. She had a tent constructed, to protect from the glaring heat of an eastern sun the invalids who were permitted to enjoy the air, and endured the mortification of a refusal, from the hospital authorities, to have the tent put up.

M. Alexis Soyer, in his "Culinary Campaign," relates the following interesting incident:

"Before leaving the battery I begged Miss Nightingale, as a favor, to give me her hand, which she did. I then requested her to ascend the stone rampart next the wooden gun carriage, and lastly to sit upon the centre mortar, to which requests she very graciously and kindly acceded. I then boldly exclaimed, 'Gentlemen, behold this amiable lady sitting fearlessly upon that terrible instrument of war. Behold the heroic daughter of England, the soldier's friend!' All present shouted, 'Bravo! bravo! Hurrah! hurrah! Long live the daughter of England!'"

At length Florence Nightingale's holy work of Christian charity was accomplished, and she prepared to return to England. The period of this event was kept a profound secret, for she ever carefully shunned publicity; and, desirous of maintaining the strictest incognito, she declined the offer of a passage in a British man-of-war, and embarked on board a French vessel. Passing through France by night, and travelling her own country unrecognized, she quietly arrived at Lea Hurst, Derbyshire, Friday, August 15, 1856.

In October, Her Majesty invited her to visit the royal residence at Balmoral; and, at a ball given there, she was seated with the royal family and the court circle at one end of the hall. On this occasion, it was noticed that her hair, which the severe attack of illness she had suffered in the Crimea necessitated cutting off, was "quite short," but a charming little cap made a very graceful head-dress.

* It is deeply interesting to learn that the apartments in the southern tower of the Barrack Hospital, formerly occupied by Miss Nightingale, now remain, even as regards the furniture they contain, precisely as they were during her residence there; a touching relic, which we owe either to our late ambassador, Lord Stratford, or to his successor, Sir Henry Bulwer.
A subscription being raised by the workingmen of Sheffield to erect a monument in that town to the memory of their countrymen who had fallen in the Crimea, a request was made, in October, to Miss Nightingale, through her relative Miss Shore, of Meersbrook Hall, that she would consent to lay the foundation stone. Miss Nightingale, in refusing, sent a check for twenty pounds towards the object proposed, but said, "It is with real pain that I feel compelled to decline the privilege, which they offer me, of laying the first stone; but I believe I shall best honor the cause of those brave dead by abstaining from appearing to court that publicity which I consider to have been my greatest impediment in the work I have engaged in for their sakes—impeding it by arousing in some minds a care for worldly distinctions."

As an instance of her large-hearted benevolence, we may cite an incident which occurred on her return. In France there exists a charitable institution,—the "Œuvre de Notre Dame D'Orient,"—under the direction of l'Abbé Legendre, almoner of the hospital of Bourbon-les-bains, a town to which large numbers of military men resort annually for the benefit of the waters. A relief fund being set on foot to aid infirm soldiers on their discharge from the hospital, Miss Nightingale forwarded a donation of one hundred francs, through Lady Fox Strangways, widow of the general who fell at Inkerman. Accompanying this donation was a graceful letter, addressed to the Abbé, in which she said, "I feel the warmest sympathy with you in the touching object of your work, and I am happy to join in it to the limited extent which my own engagements allow. I received, too, from the excellent religious ladies who were attached to the French army in the East, so many tokens of their friendship,—they gave me their assistance with such entire self-denial, and lightened my hard task in the hospital with so much devotedness, that I shall always seek any opportunity of showing my gratitude to France and to her brave children, whom I have been taught by these ladies to love and respect."

A graceful and interesting incident, in connection with the Nightingale Fund, occurred very recently. It will scarcely be forgotten that Mr. and Madame Goldschmidt contributed more than two thousand pounds to the fund, being the proceeds of a grand concert given at Exeter Hall for the purpose, when the generous donors not only performed gratuitously themselves, but insisted on defraying every expense connected with the concert. This munificence, showing that true genius is at all times kindred and sympathetic, excited such admiration, that several of those who took a deep interest in the success of the Nightingale undertaking resolved to present Mr. and Madame Goldschmidt, as a testimony of their regard, a copy in marble of Durham's bust of Her Majesty. This desire was carried into effect at the Mansion House on the 17th of last June, when the Lord Mayor, Lord Montagu, Mr. and Madame Bunsen, Mr. and Mrs. George Grote, Mr. and Mrs. S. C. Hall, Dr. Mackay, Mrs. and Miss Stanley, Mr. Bracebridge, and several other friends and subscribers, were present. The Lord Mayor offered the bust in the name of the subscribers, and truly remarked, in a very happy speech, that "gifted as Madame Goldschmidt was with the divinest faculty of song, it has been and is her greatest honor that she has ever been prepared to devote a proportion of the proceeds of her genius to the large purposes of charity."

One of the brightest, noblest names in the list of brave, heroic women, is —

FLORENCE NIGHTINGALE.

xii
FLORENCE NIGHTINGALE.

Florence Nightingale will be, through all time to come, the representative nurse par excellence. In her case it is a special calling, in virtue of natural capacity, moral and intellectual at once. She did not set out from any chosen starting point. She did not propose to earn her own salvation by a life of good works. She was not incited by visions of a religious life in a favored monastic community. She did not aspire to take in hand a department of human misery, in order to extinguish it, and then look about to see what particular misery it should be. She does not appear to have had any plans relating to herself at all. Nor was she overtaken by the plague in a village; nor did she overtake a fever in a village in the course of her travels, like her representative sisters of an earlier time; nor did she do the work of the occasion, and reenter ordinary life as if nothing had happened. Her case is special and singular in every way.

Her childhood and youth were very much like those of little girls who have wealthy parents, and carefully-chosen governesses, and good masters, and much travel — in short, all facilities for intellectual cultivation by study and extended intercourse with society, at home and abroad.

The peculiarity in the case of herself and her nearest relatives seems to be their having been reared in an atmosphere of sincerity and freedom, — of reality, in fact, — which is more difficult to obtain than might be thought. There was a certain force and sincerity of character in the elder members on both sides of the house which could not but affect the formation of the children's characters; and in this case there was a governess also whose lofty rectitude and immaculate truthfulness commanded the reverence of all who knew her.

In childhood a domestic incident disclosed to the honest-minded little girl what her liking was, and she followed the lead of her natural taste. She took care of all cuts and bruises, and nursed all illness within her reach; and there is always a good deal of these things within the reach of country gentry who are wealthy and benevolent. For the usual term of young-lady life, Florence Nightingale did as other young ladies. She saw Italy, and looked at its monuments; she once went to Egypt and Greece with the Bracebridges; she visited in society, and went to court. But her heart was not in the apparent objects of her life — not in travel for amusement, nor in art. In literature, books which disclosed life and its miseries, and character with its sufferings, burnt themselves in upon her mind, and created much of her future effort. She was never resorted to for sentiment. Sentimentalists never had a chance with her. Besides that her character was too strong, and its quality too real, for any sympathy with shallowness and egotism, she had two characteristics which might well daunt the sentimentalists — her reserve, and her capacity for ridicule. Ill would they have fared who had come to her for responsive sympathies about sentiment, or even real woes in which no practical help was proposed; and there is perhaps nothing uttered by her, from her evidence before the Sanitary Commission for the Army to her recently-published "Notes on Nursing," which does not disclose powers of irony which self-regardant persons may well dread.

Such force and earnestness must find or make a career. She evidently believes, as all persons of genius do, that she found it, while
others say she made it. Philosophy will hereafter reconcile the two
in her case and many others. As a matter of fact, while other young
ladies were busy, and perhaps better employed than usual, in enjoying
the great exhibition, she was in the Kaisarwerth Institution, on the
Rhine, going through the training for nursing, and investigating the
methods of organization there and elsewhere.

The strongest sensation she perhaps ever excited among her personal
acquaintance was when she undertook to set up the Sanitarium in
Harley Street, and left home to superintend the establishment. Her
first work there was chiefly financial; and the powers of administra-
tion she manifested were a complete justification of what she had done
in leaving her father's house to become what people called the matron
of a charity. At first common-minded people held up hands and eyes
as if she had done something almost scandalous. Between that day
and this they must have discovered that she could exalt any function,
and that no function could lower her. She rectified the accounts, paid
the debts, and brought all round; and she always had leisure to help
and comfort the sick ladies in the house. At one time, I remember,
there was not a case in the house which was not hopeless; but there
was no sign of dismay in Florence Nightingale. She completed her
task, showing unconsciously by it how a woman as well as a man may
be born to administration and command.

By a sort of treachery only too common in the visitors of celebrated
people, we have all seen the letter of Mr. Sidney Herbert, in 1854,
entreat Miss Nightingale to go—accompanied by her friends the
Braecbridges, who are familiar with life in the East—to Turkey, to
minister among the sick and wounded of our army. How soon she
was ready, and how she and her band of nurses went, and were just
in time to receive the wounded from Inkermann, no Englishman for-
gets. No man of any nation concerned will ever forget her subsequent
services. She had against her not only a chaos of disorder in which
to move, and a hell of misery around her to relieve, but special diffi-
culties in the jealousy of the medical officers, the rawness of the nurses
so hastily collected, and the incompatibilities of the volunteer ladies
who started on the enterprise with her or after her. On the state of
the hospitals it can, I hope, never be necessary to enlarge again. We
all know how, under her superintendence, places became clean and
airy, and persons cleanly, clothed, fed, and afforded some chance of
recovery from maladies or wounds. While history abides, the image
of Florence Nightingale, lamp in hand, going through miles of beds,
night by night, noting every patient as she went, and ministering
wherever most wanted, will always glow in men's hearts; and the
sayings of the men about her will be traditions for future generations
to enjoy.

She was prostrated by the Crimean fever at Balaklava, and carried
up to the hospital on the cliffs till she began to mend, when she was
taken to sea. She would not come home, because her work at Scutari
was not finished. She remained there till the end of the war; by
which time she and her military and medical coadjutors had shown
what hospitals may be, and how low the rate of mortality of an army
may be reduced, even in time of war.

She has never recovered from that fever; and for some years she has
been confined by severe and increasing illness. Not the less has she
worked, steadily and most efficiently. She cannot fulfil her aim—
of training nurses in an institution of her own, and thus raising up a
body of successors. The grateful people of England supplied the
means, without her knowledge or desire, which was the same thing as imposing a new service upon her. She wished to decline it when she found how little likely her health was to improve. Her letter to the trustees of the fund must be fresh in all memories, and the reply of the trustees, who satisfied her that the money was accumulating, and the plan and the public able and willing to wait. If she could not do this particular work, she has done many others. Her written evidence before the Sanitary Commission for the Army is a great work in itself. So are various reforms urged on the military authorities by her and her coadjutors, and now adopted by the war office. Reforms in the Indian army are about to follow. The lives thus saved no one will attempt to number; and the amount of misery and vice precluded by her scientific humanity is past all estimate.

Her "Notes on Nursing," prepared and issued in illness and pain, are the crowning evidence of what she is, and can do. Hitherto we have, I trust, appreciated and honored her acts; now we are enabled to perceive and appreciate her mind. It was as certain before as it can ever be that she must have acquired no little science, in various departments, to produce the effects she wrought; but we see it all now.

We see also, much more clearly than ever, her moral characteristics. I will not describe them when they can be so much better seen in her "Notes on Nursing." Any one who reads those Notes without being moved in the depths of his heart will not understand the writer of them by any amount of description; and those who have been so moved do not need and will not tolerate it. The intense and exquisite humanity to the sick, underlying the glorious common sense about affairs, and the stern insight into the weaknesses and the perversions of the healthy, troubled as they are by the sight of suffering, and sympathizing with themselves instead of the patient, lay open a good deal of the secret of this wonderful woman's life and power. We begin to see how a woman, any thing but robust at any time, may have been able, as well as willing, to undertake whatever was most repulsive and most agonizing in the care of wounded soldiers and crowds of cholera patients. We see how her minute economy and attention to the smallest details are reconcilable with the magnitude of her administration, and the comprehensiveness of her plans for hospital establishments and for the reduction of the national rate of mortality. As the lives of the sick hang on small things, she is as earnest about the quality of a cup of arrowroot, and the opening and shutting of doors, as about the institution of a service between the commissariat and the regimental, which shall insure an army against being starved when within reach of food. In the mind of a true nurse nothing is too great or too small to be attended to with all diligence; and therefore we have seen Florence Nightingale doing and insisting upon the right about shirts and towels, spoon-meats, and the boiling of rice, and largely aiding in reducing the mortality of the army from nineteen in the thousand to eight, in times of peace.

In the spirit and tone of this book we see, too, how it is that, with all her fame, we have known so little of the woman herself. Where it is of use to tell any piece of her own experience, she tells it; and these scraps of autobiography will be eagerly seized upon by all kinds of readers; but, except for the purpose of direct utility, she never speaks of herself, more or less, or even discloses any of her opinions, views, or feelings. This reserve is a great distinction in these days of self-exposure, and descanting on personal experiences. It is the best possible rebuke to the egotism, or the sentimentality, which has led
several ladies to imagine that they could be nurses, without having tried whether they could bear the discipline. Her pure, undisguised common sense, and her keen perception of all deviations from common sense, may have turned back more or fewer women from the nursing vocation; but this is probably an unmixed good; for those who could be thus turned back were obviously unfit to proceed. She is the representative of those only who are nurses; that is, capable of the hardest and highest duties and sacrifices which women can undertake from love to their race.

In the end she will have won over far more than she can have (most righteously and mercifully) discouraged. Generations of women for centuries to come will be the better, the more helpful, and the more devoted for Florence Nightingale having lived; and no small number of each generation will try their strength on that difficult path of beneficence which she has opened, and on which her image will forever stand to show the way.

INGLEBY SCOTT.

THE JEWEL PRESENTED TO MISS NIGHTINGALE,
BY QUEEN VICTORIA.
INDEX.

DISEASE a reformatory process, 7
Of the sufferings of disease; disease must always be the cause, 7
What nursing ought to do, 8
Nursing the sick little understood, 8
Nursing ought to assist the reformatory process, 9
Nursing the well little understood, 9
Curious deductions from an excessive death rate, 9
First rule of nursing to keep the air within as pure as the air without, 11
Why are uninhabited rooms shut up? 11
Without chill, 12
Open windows, 13
What kind of warmth desirable, 13
Bedrooms almost universally foul, 13
An air test of essential consequence, 14
When warmth must be most carefully looked to, 14
Cold air not ventilation, 15
Night air, Air from outside. Open your windows, shut your doors, 16
Smoke. Airing damp things in a patient's room. Effluvia from excreta, 17
Chamber utensils without lids, 18
Don't make your sick room into a sewer, 18
Pure air. Pure water, 20
Drainage. Sinks, 21
Cleanliness. Light, 22
Three common errors in managing the health of houses, 22
Head in charge must see to house hygiene, not do it herself, 23
Does one think of these things seriously? 23
How does he carry out his laws? 24
How does he teach his laws? 24
Servants' rooms, 24
Physical degeneration in families; its causes. Don't make your sick room into a ventilating shaft for the whole house. Infection. Diseases are not individuals arranged in classes, like cats and dogs, but conditions growing out of one another, 25
Why must children have measles, &c.? Petty management, 26
Illustrations of the want of it, 28
Strangers coming into sick room, 28
Sick room airing the whole house, 28
Uninhabited room fouling the whole house. Lingeringsmell of medicinal vapours, 28
Delivery and non-delivery of letters and messages, 29
Partial measures such as "being al-

ways in the way" yourself, increase instead of saving the patient's anxiety, because they must be only partial. Why let your patient ever be surprised? 29
What is the cause of half the accidents which happen? 30
Petty management better understood in institutions than in private houses. What institutions are the exception? Nursing in regimental hospitals, 31
What is it to be "in charge," 32
Why hired nurses give so much trouble. Unnecessary noise. Never let a patient be waked out of his first sleep, 34
Noise which excites expectation, 35
Whispered conversation in the room, or just outside the door, 35, 36
Noise of female dress. Patient's repulsion to nurses who rustle, 36
Burning of the crinolines, 37
Indecency of the crinolines, 37
Hurry peculiarly hurtful to sick, 37
How to visit the sick, and not hurt them. These things not fancy, 38
Interruption damaging to sick and to well, 38
Keeping a patient standing. Patients dread surprise. Never speak to a patient in the act of moving, 39
Careless observation of the results of careless visits, 39
Difference between real and fancy patients, 41
Conscience necessary with sick, 41
Irresolution most painful to them, 42
What a patient must not have to see to, Reading aloud, 42
Reading slowly; distinctly, and steadily to the sick, 43
Never read aloud by fits and starts to the sick. The sick would rather be told a thing than have it read to them, 43
People overhead. Music, 44
Variety a means of recovery, 44
Color and form means of recovery; this is no fancy. Flowers, 45
Effect of body on mind, 46
Sick suffer to excess from mental as well as bodily pain. Help the sick to vary their thoughts, 46
Desperate desire in the sick to "see out of window." Supply to the sick the defect of manual labor, 47
Physical effect of color. Want of attention to hours of taking food, 48
Lice often hangs upon minutes in taking food, 49
Patients often starved to death in chronic cases. Food never to be left by the patient's side. Pa-

INDEX.

Patient had better not see more food than his own, ........ 50
You cannot be too careful as to quality in sick diet, .......... 51
Nurse must have some rule of thought about her patient's diet. Nurse must have some rule of time about the patient's diet, .... 52
Arrowroot. Milk, butter, cream, &c. Intelligent cravings of particular sick for particular articles of diet, 54
Sweet things. Jelly, ............................ 55
Beef tea. Observation, not chemistry, must decide sick diet. .... 56
Home-made bread, sound observation has scarcely yet been brought to bear on sick diet, ........ 57
Tea and coffee. Cocoa, ........ 58, 59
Bulk. Feverishness a symptom of beddng, Uneasiness of ordinary beddng. Nurses often do not think the room clean enough of theirs, but only the sick, 60
Air your dirty sheets, not only your clean ones, .................. 61
Iron spring bedsteads the best. Comfort and cleanliness of two beds. Bed not to be too wide, ........ 62
Bed not to be too high, low poster, dark place, nor a four poster with curtains. Scrofula often a result of disposition of bed clothes. Red sores. Heavy and impervious bed clothes, .......... 63
Light essential to both health and recovery, .................. 64
Aspect, view, and sunlight, matters of first importance to the sick, .... 65
Without sunlight, we degenerate body and mind. Almost all patients lie with their faces to the light. Cleanliness of carpets and furniture, .......... 66
Dust never removed now. How a room is dusted, ........ 67
Floors. Papered, plastered, oil-painted walls. Atmosphere in painted and papered rooms quite distinguishable. Best kind of wall for a sick room. How to keep your wall clean at the expense of your clothes, .......... 68
Dirty air from without. Best kind of wall for a house. Dirty air from within. Dirty air from the carpet. Remedies, .......... 69
Poisoning by the skin, ...................... 70
Ventilation and skin-cleanness equally essential, .......... 71
Steaming and rubbing the skin. Advising the sick, .......... 72
Chattering hopeless the bane of the sick, ...................... 73
Patient does not want to talk of himself. Absurd statistical comparisons made in common con-
versation by the most sensible people for the benefit of the sick. Absurd consolations put forth for the benefit of the sick, ........ 74
Wonderful presumption of the adviners of the sick. Advisers the same now as two hundred years ago. Mockery of the advice given to sick, 75
Means of giving pleasure to the sick, ........ 77
Two new classes of patients peculiar to this generation. What is the use of the question, Is he better? ........ 79
Leading questions useless or misleading, .................. 81
Means of obtaining inaccurate in-
formation, .......... 82
As to food patient takes or does not take, ........ 83
As to diarrhoea. More important to spare the patient thought than physical exertion. Means of culti-
vating sound and ready observation, .......... 83, 84
Sound and ready observation essential in a nurse, .......... 85
English women have great capacity of, but little practice in, close ob-
observation, .......... 86
Difference of excitable and accumula-
tive temperaments. Superficial the fruit of bad observation. Physiognomy of disease little shown by the face, .......... 87
Peculiarities of patients. Nurse must observe for herself increase of patient's weakness; patient will not tell her. Accidents arising from the nurse's want of ob-
observation, .......... 89
Is the faculty of observing on the decline? Observation of general conditions. Approach of death; paleness by no means an invaria-
table sign, as we find in novel cases. "Average rate of mortality" tells us only that so many per cent. will die. Observation must tell us which in the hundred they will be who will die, .......... 93
What observation is for. What a confidential nurse should be, .......... 94
Observation is for practical pur-
poses. Sanitary nursing as essential in surgical as in medical cases, but not to supersede surgical nursing, .......... 95
Children; their greater susceptibility to the same things, .......... 96
Summary. Reckless amateur physically by women. Real knowledge of the laws of health alone can check this. Danger of physically by amateur females, .......... 98
What pathology teaches. What observa-
sion alone teaches. What medicine does. What nature alone does, .......... 103
NOTES ON NURSING:

WHAT IT IS AND WHAT IT IS NOT.

Shall we begin by taking it as a general principle—that all disease, at some period or other of its course, is more or less a reparative process, not necessarily accompanied with suffering: an effort of nature to remedy a process of poisoning or of decay, which has taken place weeks, months, sometimes years beforehand, unnoticed, the termination of the disease being then, while the antecedent process was going on, determined?

If we accept this as a general principle, we shall be immediately met with anecdotes and instances to prove the contrary. Just so if we were to take, as a principle—all the climates of the earth are meant to be made habitable for man, by the efforts of man—the objection would be immediately raised,—Will the top of Mount Blanc ever be made habitable? Our answer would be, It will be many thousands of years before we have reached the bottom of Mount Blanc in making the earth healthy. Wait till we have reached the bottom before we discuss the top.

In watching diseases, both in private houses and in public hospitals, the thing which strikes the experienced observer most forcibly is this, that the symptoms or the sufferings generally considered to be inevitable and incident to the disease are very often not symptoms of the disease at all, but of something quite different—of the want of fresh air, or of light, or of warmth, or of quiet, or of cleanliness, or of punctuality and care in the administration of diet, of each or of all of these. And this quite as much in private as in hospital nursing.

The reparative process which Nature has instituted and
which we call disease, has been hindered by some want of knowledge or attention, in one or in all of these things, and pain, suffering, or interruption of the whole process sets in.

If a patient is cold, if a patient is feverish, if a patient is faint, if he is sick after taking food, if he has a bed-sore, it is generally the fault not of the disease, but of the nursing.

I use the word nursing for want of a better. It has been limited to signify little more than the administration of medicines and the application of poultices. It ought to signify the proper use of fresh air, light, warmth, cleanliness, quiet, and the proper selection and administration of diet—all at the least expense of vital power to the patient.

It has been said and written scores of times, that every woman makes a good nurse. I believe, on the contrary, that the very elements of nursing are all but unknown.

By this I do not mean that the nurse is always to blame. Bad sanitary, bad architectural, and bad administrative arrangements often make it impossible to nurse. But the art of nursing ought to include such arrangements as alone make what I understand by nursing, possible.

The art of nursing, as now practised, seems to be expressly constituted to unmake what God had made disease to be, viz., a reparative process.

To recur to the first objection. If we are asked, Is such or such a disease a reparative process? Can such an illness be unaccompanied with suffering? Will any care prevent such a patient from suffering this or that?—I humbly say, I do not know. But when you have done away with all that pain and suffering, which in patients are the symptoms, not of their disease, but of the absence of one or all of the above-mentioned essentials to the success of Nature's reparative processes, we shall then know what are the symptoms of and the sufferings inseparable from the disease.

Another and the commonest exclamation which will be instantly made is—Would you do nothing, then, in cholera, fever, &c.?—so deep-rooted and universal is the conviction that to give medicine is to be doing something, or rather every thing; to give air, warmth, cleanliness, &c., is to do nothing. The reply is, that in these and many
other similar diseases the exact value of particular remedies and modes of treatment is by no means ascertained, while there is universal experience as to the extreme importance of careful nursing in determining the issue of the disease.

II. The very elements of what constitutes good nursing are as little understood for the well as for the sick. The same laws of health or of nursing, for they are in reality the same, obtain among the well as among the sick. The breaking of them produces only a less violent consequence among the former than among the latter,—and this sometimes, not always.

It is constantly objected,—"But how can I obtain this medical knowledge? I am not a doctor. I must leave this to doctors."

O, mothers of families! You who say this, do you know that one in every seven infants in this civilized land of England perishes before it is one year old? That, in London, two in every five die before they are five years old? And, in the other great cities of England, nearly one out of two?* "The life duration of tender babies"

* Upon this fact the most wonderful deductions have been strung. For a long time an announcement something like the following has been going the round of the papers: "More than 25,000 children die every year in London under 10 years of age; therefore we want a Children's Hospital." This spring there was a prospectus issued, and divers other means taken to this effect: "There is a great want of sanitary knowledge in women; therefore we want a Woman's Hospital." Now, both the above facts are too sadly true. But what is the deduction? The causes of the enormous child-mortality are perfectly well known; they are chiefly want of cleanliness, want of ventilation, want of whitewashing; in one word, defective household hygiene. The remedies are just as well known; and among them is certainly not the establishment of a Child's Hospital. This may be a want; just as there may be a want of hospital room for adults. But the Registrar-General would certainly never think of giving us as a cause for the high rate of child-mortality in (say) Liverpool that there was not sufficient hospital room for children; nor would he urge upon us, as a remedy, to found a hospital for them.

Again, women, and the best women, are wofully deficient in sanitary knowledge; although it is to women that we must look, first and last, for its application, as far as household hygiene is concerned. But who would ever think of citing the institution of a Woman's Hospital as the way to cure this want?

We have it, indeed, upon very high authority that there is some fear lest hospitals, as they have been hitherto, may not have generally increased, rather than diminished, the rate of mortality — especially of child-mortality.
(as some Saturn, turned analytical chemist, says) "is the most delicate test" of sanitary conditions. Is all this premature suffering and death necessary? Or did Nature intend mothers to be always accompanied by doctors? Or is it better to learn the piano-forte than to learn the laws which subserve the preservation of offspring?

Macaulay somewhere says, that it is extraordinary that, whereas the laws of the motions of the heavenly bodies, far removed as they are from us, are perfectly well understood, the laws of the human mind, which are under our observation all day and every day, are no better understood than they were two thousand years ago.

But how much more extraordinary is it that, whereas what we might call the coxcomberies of education — e. g., the elements of astronomy — are now taught to every school-girl, neither mothers of families of any class, nor school-mistresses of any class, nor nurses of children, nor nurses of hospitals, are taught anything about those laws which God has assigned to the relations of our bodies with the world in which He has put them. In other words, the laws which make these bodies, into which He has put our minds, healthy or unhealthy organs of those minds, are all but unlearnt. Not but that these laws — the laws of life — are in a certain measure understood, but not even mothers think it worth their while to study them — to study how to give their children healthy existences. They call it medical or physiological knowledge, fit only for doctors.

Another objection.

We are constantly told, — "But the circumstances which govern our children's healths are beyond our control. What can we do with winds? There is the east wind. Most people can tell before they get up in the morning whether the wind is in the east."

To this, one can answer with more certainty than to the former objections. Who is it who knows when the wind is in the east? Not the Highland drover, certainly, exposed to the east wind, but the young lady who is worn out with the want of exposure to the fresh air, to sunlight, &c. Put the latter under as good sanitary circumstances as the former, and she too will not know when the wind is in the east.
I. VENTILATION AND WARMING.

The very first canon of nursing, the first and the last thing upon which a nurse's attention must be fixed, the first essential to a patient, without which all the rest you can do for him is as nothing, with which I had almost said you may leave all the rest alone, is this: To keep the air he breathes as pure as the external air, without chilling him. Yet what is so little attended to? Even where it is thought of at all, the most extraordinary misconceptions reign about it. Even in admitting air into the patient's room or ward, few people ever think, where that air comes from. It may come from a corridor into which other wards are ventilated, from a hall, always unaired, always full of the fumes of gas, dinner, of various kinds of mustiness; from an underground kitchen, sink, washhouse, water-closet, or even, as I myself have had sorrowful experience, from open sewers loaded with filth; and with this the patient's room or ward is aired, as it is called—poisoned, it should rather be said. Always air from the air without, and that, too, through those windows through which the air comes freshest. From a closed court, especially if the wind do not blow that way, air may come as stagnant as any from a hall or corridor.

Again, a thing I have often seen both in private houses and institutions. A room remains uninhabited; the fireplace is carefully fastened up with a board; the windows are never opened; probably the shutters are kept always shut; perhaps some kind of stores are kept in the room; no breath of fresh air can by possibility enter into that room, nor any ray of sun. The air is stagnant, musty, and corrupt as it can by possibility be made. It is quite ripe to breed small-pox, scarlet-fever, diphtheria, or any thing else you please.*

Yet the nursery, ward, or sick room adjoining will posi

* The common idea as to uninhabited rooms is, that they may safely be left with doors, windows, shutters, and chimney-board, all closed—hermetically sealed if possible—to keep out the dust, it is said and that no harm will happen if the room is but opened a short hour before the inmates are put in. I have often been asked the question for uninhabited rooms, "But when ought the windows to be opened?" The answer is, "When ought they to be shut?"
tively be aired (?) by having the door opened into that room. Or children will be put into that room, without previous preparation, to sleep.

A short time ago a man walked into a back-kitchen in Queen square, and cut the throat of a poor consumptive creature, sitting by the fire. The murderer did not deny the act, but simply said, “It's all right.” Of course he was mad.

But in our case, the extraordinary thing is that the victim says, “It's all right,” and that we are not mad. Yet, although we “nose” the murderers, in the musty, unaired, unsunned room, the scarlet fever which is behind the door, or the fever and hospital gangrene which are stalking among the crowded beds of a hospital ward, we say, “It's all right.”

With a proper supply of windows, and a proper supply of fuel in open fire-places, fresh air is comparatively easy to secure when your patient or patients are in bed. Never be afraid of open windows then. People don’t catch cold in bed. This is a popular fallacy. With proper bed-clothes and hot bottles, if necessary, you can always keep a patient warm in bed, and well ventilate him at the same time.

But a careless nurse, be her rank and education what it may, will stop up every cranny and keep a hot-house heat when her patient is in bed,—and, if he is able to get up, leave him comparatively unprotected. The time when people take cold (and there are many ways of taking cold, besides a cold in the nose,) is when they first get up after the two-fold exhaustion of dressing and of having had the skin relaxed by many hours, perhaps days, in bed, and thereby rendered more incapable of reaction. Then the same temperature which refreshes the patient in bed may destroy the patient just risen. And common sense will point out, that, while purity of air is essential, a temperature must be secured which shall not chill the patient. Otherwise the best that can be expected will be a feverish reaction.

To have the air within as pure as the air without, it is not necessary, as often appears to be thought, to make it as cold.

In the afternoon again, without care, the patient whose vital powers have then risen often finds the room as close
and oppressive as he found it cold in the morning. Yet the nurse will be terrified, if a window is opened.*

I know an intelligent humane house surgeon who makes a practice of keeping the ward windows open. The physicians and surgeons invariably close them while going their rounds; and the house surgeon very properly as invariably opens them whenever the doctors have turned their backs.

In a little book on nursing, published a short time ago, we are told, that, "with proper care it is very seldom that the windows cannot be opened for a few minutes twice in the day to admit fresh air from without." I should think not; nor twice in the hour either. It only shows how little the subject has been considered.

Of all methods of keeping patients warm the very worst certainly is to depend for heat on the breath and bodies of the sick. I have known a medical officer keep his ward windows hermetically closed. Thus exposing the sick to all the dangers of an infected atmosphere, because he was afraid that, by admitting fresh air, the temperature of the ward would be too much lowered. This is a destructive fallacy.

To attempt to keep a ward warm at the expense of making the sick repeatedly breathe their own hot, humid, putreasing atmosphere is a certain way to delay recovery or to destroy life.

Do you ever go into the bed-rooms of any persons of any class, whether they contain one, two, or twenty people, whether they hold sick or well, at night, or before the windows are opened in the morning, and ever find the air any thing but unwholesomely close and foul? And why should it be so? And of how much importance is it that it should not be so? During sleep, the human body, even when in health, is far more injured by the influence of foul air than when awake. Why can't you keep the air all

* It is very desirable that the windows in a sick room should be such that the patient shall, if he can move about, be able to open and shut them easily himself. In fact, the sick room is very seldom kept aired if this is not the case — so very few people have any perception of what is a healthy atmosphere for the sick. The sick man often says, "This room where I spend 22 hours out of the 24, is fresher than the other where I only spend 2. Because here I can manage the windows myself." And it is true.
night, then, as pure as the air without in the rooms you sleep in? But for this, you must have sufficient outlet for the impure air you make yourselves to go out; sufficient inlet for the pure air from without to come in. You must have open chimneys, open windows, or ventilators; no close curtains round your beds; no shutters or curtains to your windows, none of the contrivances by which you undermine your own health or destroy the chances of recovery of your sick.*

A careful nurse will keep a constant watch over her sick, especially weak, protracted, and collapsed cases, to guard against the effects of the loss of vital heat by the patient himself. In certain diseased states much less heat is produced than in health; and there is a constant tendency to the decline and ultimate extinction of the vital powers by the call made upon them to sustain the heat of the body. Cases where this occurs should be watched with the greatest care from hour to hour; I had almost said

*Dr. Angus Smith's air-test, if it could be made of simpler application, would be invaluable to use in every sleeping and sick room. Just as without the use of a thermometer no nurse should ever put a patient into a bath, so should no nurse, or mother, or superintendent, be without the air-test in any ward, nursery, or sleeping-room. If the main function of a nurse is to maintain the air within the room as fresh as the air without, without lowering the temperature, then she should always be provided with a thermometer which indicates the temperature, with an air-test which indicates the organic matter of the air. But to be used, the latter must be made as simple a little instrument as the former, and both should be self-registering. The senses of nurses and mothers become so dulled to foul air, that they are perfectly unconscious of what an atmosphere they have let their children, patients, or charges, sleep in. But if the tell-tale air-test were to exhibit in the morning, both to nurses and patients, and to the superior officer going round, what the atmosphere has been during the night, I question if any greater security could be afforded against a recurrence of the misdemeanor.

And O, the crowded national school! where so many children's epidemics have their origin, what a tale its air-test would tell! We should have parents saying, and saying rightly, "I will not send my child to that school, the air-test stands at 'Horrid.'" And the dormitories of our great boarding schools! Scarlet fever would be no more ascribed to contagion, but to its right cause, the air-test standing at "Foul."

We should hear no longer of "Mysterious Dispensations," and of "Plague and Pestilence," being "in God's hands," when, so far as we know, He has put them into our own. The little air-test would both betray the cause of these "mysterious pestilences," and call upon us to remedy it.
from minute to minute. The feet and legs should be examined by the hand from time to time, and whenever a tendency to chilling is discovered, hot bottles, hot bricks, or warm flannels, with some warm drink, should be made use of until the temperature is restored. The fire should be, if necessary, replenished. Patients are frequently lost in the latter stages of disease from want of attention to such simple precautions. The nurse may be trusting to the patient's diet, or to his medicine, or to the occasional dose of stimulant which she is directed to give him, while the patient is all the while sinking from want of a little external warmth. Such cases happen at all times, even during the height of summer. This fatal chill is most apt to occur towards early morning at the period of the lowest temperature of the twenty-four hours, and at the time when the effect of the preceding day's diets is exhausted.

Generally speaking, you may expect that weak patients will suffer cold much more in the morning than in the evening. The vital powers are much lower. If they are feverish at night, with burning hands and feet, they are almost sure to be chilly and shivering in the morning. But nurses are very fond of heating the foot-warmer at night, and of neglecting it in the morning, when they are busy. I should reverse the matter.

All these things require common sense and care. Yet, perhaps, in no one single thing is so little common sense shown, in all ranks, as in nursing.*

The extraordinary confusion between cold and ventilation, even in the minds of well educated people, illustrates

With private sick, I think, but certainly with hospital sick, the nurse should never be satisfied as to the freshness of their atmosphere, unless she can feel the air gently moving over her face, when still.

But it is often observed that the nurses who make the greatest outcry against open windows, are those who take the least pains to prevent dangerous draughts. The door of the patients' room or ward must sometimes stand open to allow of persons passing in and out, or heavy things being carried in and out. The careful nurse will keep the door shut while she shuts the windows, and then, and not before, set the door open, so that a patient may not be left sitting up in bed, perhaps in a profuse perspiration, directly in the draught between the open door and window. Neither, of course, should a patient, while being washed or in any way exposed, remain in the draught of an open window or door.
this. To make a room cold is by no means necessarily to venti-
late it. Nor is it at all necessary, in order to venti-
late a room, to chill it. Yet, if a nurse finds a room close,  
she will let out the fire, thereby making it closer, or she  
will open the door into a cold room, without a fire, or an  
open window in it, by way of improving the ventilation.  
The safest atmosphere of all for a patient is a good fire  
and an open window, excepting in extremes of tempera-
ture. (Yet no nurse can ever be made to understand  
this.) To ventilate a small room without draughts of  
course requires more care than to ventilate a large one.  

Another extraordinary fallacy is the dread of night air.  
What air can we breathe at night but night air? The  
choice is between pure night air from without and foul  
night air from within. Most people prefer the latter. An  
unaccountable choice. What will they say if it is proved  
to be true that fully one-half of all the disease we suffer  
from is occasioned by people sleeping with their windows  
shut? An open window most nights in the year can  
ever hurt any one. This is not to say that light is not  
necessary for recovery. In great cities, night air is often  
the best and purest air to be had in the twenty-four hours.  
I could better understand in towns shutting the windows  
during the day than during the night, for the sake of the  
sick. The absence of smoke, the quiet, all tend to making  
night the best time for airing the patients. One of our  
highest medical authorities on Consumption and Climate  
has told me that the air in London is never so good as  
after ten o'clock at night.

Always air your room, then, from the outside air, if pos-
sible. Windows are made to open; doors are made to  
shut—a truth which seems extremely difficult of appre-
hension. I have seen a careful nurse airing her patient's  
room though the door, near to which were two gaslights,  
(each of which consumes as much air as eleven men,) a  
kitchen, a corridor, the composition of the atmosphere in  
which consisted of gas, paint, foul air, never changed, full  
of effluvia, including a current of sewer air from an ill-
placed sink, ascending in a continual stream by a well-
staircase, and discharging themselves constantly into the  
patient's room. The window of the said room, if opened,  
was all that was desirable to air it. Every room must be
aired from without—every passage from without. But the fewer passages there are in a hospital the better.

If we are to preserve the air within as pure as the air without, it is needless to say that the chimney must not smoke. Almost all smoky chimneys can be cured—from the bottom, not from the top. Often it is only necessary to have an inlet for air to supply the fire, which is feeding itself, for want of this, from its own chimney. On the other hand, almost all chimneys can be made to smoke by a careless nurse, who lets the fire get low and then overwhelms it with coal; not, as we verily believe, in order to spare herself trouble, (for very rare is unkindness to the sick,) but from not thinking what she is about.

In laying down the principle that the first object of the nurse must be to keep the air breathed by her patient as pure as the air without, it must not be forgotten that every thing in the room which can give off effluvia, besides the patient, evaporates itself into his air. And it follows that there ought to be nothing in the room, excepting him, which can give off effluvia or moisture. Out of all damp towels, &c., which become dry in the room, the damp, of course, goes into the patient's air. Yet this "of course" seems as little thought of, as if it were an obsolete fiction. How very seldom you see a nurse who acknowledges by her practice that nothing at all ought to be aired in the patient's room, that nothing at all ought to be cooked at the patient's fire! Indeed the arrangements often make this rule impossible to observe.

If the nurse be a very careful one, she will, when the patient leaves his bed, but not his room, open the sheets wide, and throw the bed-clothes back, in order to air his bed. And she will spread the wet towels and flannels carefully out upon a horse, in order to dry them. Now either these bed-clothes and towels are not dried and aired, or they dry and air themselves into the patient's air. And whether the damp and effluvia do him most harm in his air or in his bed, I leave to you to determine, for I cannot.

Even in health people cannot repeatedly breathe air in which they live with impunity, on account of its becoming charged with unwholesome matter from the lungs and skin. In disease where every thing given off from the body is highly noxious and dangerous, not only must there be plenty of ventilation to carry off the effluvia, but every
thing which the patient passes must be instantly removed away, as being more noxious than even the emanations from the sick.

Of the fatal effects of the effluvia from the excreta it would seem unnecessary to speak, were they not so constantly neglected. Concealing the utensils behind the vallance to the bed seems all the precaution which is thought necessary for safety in private nursing. Did you but think for one moment of the atmosphere under that bed, the saturation of the under side of the mattress with the warm evaporations, you would be startled and frightened too!

The use of any chamber utensil without a lid* should be utterly abolished, whether among sick or well. You can easily convince yourself of the necessity of this absolute rule, by taking one with a lid, and examining the under side of that lid. It will be found always covered, whenever the utensil is not empty, by condensed offensive moisture. Where does that go, when there is no lid?

Earthenware, or if there is any wood, highly polished and varnished wood, are the only materials fit for patients’

* But never, never should the possession of this indispensable lid confirm you in the abominable practice of letting the chamber utensil remain in a patient’s room unemptied, except once in the 24 hours, i.e., when the bed is made. Yes, impossible as it may appear, I have known the best and most attentive nurses guilty of this; ay, and have known, too, a patient afflicted with severe diarrhoea for ten days, and the nurse (a very good one) not know of it, because the chamber utensil (one with a lid) was emptied only once in 24 hours, and that by the housemaid who came in and made the patient’s bed every evening. As well might you have a sewer under the room, or think that in a water-closet the plug need be pulled up but once a day. Also take care that your lid, as well as your utensil, be always thoroughly rinsed.

If a nurse declines to do these kinds of things for her patient, “because it is not her business,” I should say that nursing was not her calling. I have seen surgical “sisters,” women whose hands were worth to them two or three guineas a-week, down upon their knees scouring a room or hut, because they thought it otherwise not fit for their patients to go into. I am far from wishing nurses to scour. It is a waste of power. But I do say that these women had the true nurse-calling — the good of their sick first, and second only the consideration what it was their “place” to do — and that women who wait for the housemaid to do this, or for the charwoman to do that, when their patients are suffering, have not the making of a nurse in them.
utensils. The very lid of the old abominable close-stool is enough to breed a pestilence. It becomes saturated with offensive matter, which scouring is only wanted to bring out. I prefer an earthenware lid as being always cleaner. But there are various good new-fashioned arrangements.

A slop-pail should never be brought into a sick room. It should be a rule invariable, rather more important in the private house than elsewhere, that the utensil should be carried directly to the water-closet, emptied there, rinsed there, and brought back. There should always be water and a cock in every water-closet for rinsing. But even if there is not, you must carry water there to rinse with. I have actually seen, in the private sick room, the utensils emptied into the foot-pan, and put back un-rinsed under the bed. I can hardly say which is most abominable, whether to do this or to rinse the utensil in the sick room. In the best hospitals it is now a rule that no slop-pail shall ever be brought into the wards, but that the utensils shall be carried direct to be emptied and rinsed at the proper place. I would it were so in the private house.

Let no one ever depend upon fumigations, "disinfectants," and the like, for purifying the air. The offensive thing, not its smell, must be removed. A celebrated medical lecturer began one day, "Fumigations, gentlemen, are of essential importance. They make such an abominable smell that they compel you to open the window." I wish all the disinfecting fluids invented made such an "abominable smell" that they forced you to admit fresh air. That would be a useful invention.

HEALTH OF HOUSES.*

There are five essential points in securing the health of houses:—

1. Pure air.
2. Pure water.
3. Efficient drainage.
5. Light.

* The health of carriages, especially close carriages, is not of sufficient universal importance to mention here, otherwise than cursorily. Children, who are always the most delicate test of sanitary conditions,
Without these, no house can be healthy. And it will be unhealthy just in proportion as they are deficient.

1. To have pure air, your house must be so constructed as that the outer atmosphere shall find its way with ease to every corner of it. House architects hardly ever consider this. The object in building a house is to obtain the largest interest for the money, not to save doctors' bills to the tenants. But, if tenants should ever become so wise as to refuse to occupy unhealthy constructed houses, and if Insurance Companies should ever come to understand their interest so thoroughly as to pay a Sanitary Surveyor to look after the houses where their clients live, speculative architects would speedily be brought to their senses. As it is, they build what pays best. And there are always people foolish enough to take the houses they build. And if in the course of time the families die off, as is so often the case, nobody ever thinks of blaming any but Providence* for the result. Ill-informed medical men aid in sustaining the delusion, by laying the blame on "current contagions." Badly constructed houses do for the healthy what badly constructed hospitals do for the sick. Once insure that the air in a house is stagnant, and sickness is certain to follow.

2. Pure water is more generally introduced into houses than it used to be, thanks to the exertions of the sanitary reformers. Within the last few years, a large part of London was in the daily habit of using water polluted by the drainage of its sewers and water-closets. This has happily been remedied. But, in many parts of the country, well generally cannot enter a close carriage without being sick — and very lucky for them that it is so. A close carriage, with the horse-hair cushions and linings always saturated with organic matter, if to this be added the windows up, is one of the most unhealthy of human receptacles. The idea of taking an airing in it is something preposterous. Dr. Angus Smith has shown that a crowded railway carriage, which goes at the rate of 30 miles an hour, is as unwholesome as the strong smell of a sewer, or as a back yard in one of the most unhealthy courts off one of the most unhealthy streets in Manchester.

*God lays down certain physical laws. Upon his carrying out such laws depends our responsibility (that much abused word), for how could we have any responsibility for actions, the results of which we could not foresee — which would be the case if the carrying out of His laws were not certain. Yet we seem to be continually expecting that he will work a miracle — i.e., break His own laws expressly to relieve us of responsibility.
HEALTH OF HOUSES.

21

water of a very impure kind is used for domestic purposes. And when epidemic disease shows itself, persons using such water are almost sure to suffer.

3. It would be curious to ascertain by inspection, how many houses in London are really well drained. Many people would say, surely all or most of them. But many people have no idea in what good drainage consists. They think that a sewer in the street, and a pipe leading to it from the house, is good drainage. All the while the sewer may be nothing but a laboratory from which epidemic disease and ill health is being distilled into the house. No house with any untrapped drain pipe communicating immediately with a sewer, whether it be from water-closet, sink, or gully-grate, can ever be healthy. An untrapped sink may at any time spread fever or pyæmia among the inmates of a palace.

The ordinary oblong sink is an abomination. That great surface of stone, which is always left wet, is always exhaling into the air. I have known whole houses and hospitals smell of the sink. I have met just as strong a stream of sewer air coming up the back staircase of a grand London house from the sink, as I have ever met at Scutari; and I have seen the rooms in that house all ventilated by the open doors, and the passages all unventilated by the closed windows, in order that as much of the sewer air as possible might be conducted into and retained in the bed-rooms. It is wonderful.

Another great evil in house construction is carrying drains underneath the house. Such drains are never safe. All house drains should begin and end outside the walls. Many people will readily admit, as a theory, the importance of these things. But how few are there who can intelligently trace disease in their households to such causes! Is it not a fact, that when scarlet fever, measles, or small-pox appear among the children, the very first thought which occurs is, “where” the children can have “caught” the disease? And the parents immediately run over in their minds all the families with whom they may have been. They never think of looking at home for the source of the mischief. If a neighbor's child is seized with small-pox, the first question which occurs is whether it had been vaccinated. No one would undervalue vaccination; but it becomes of doubtful benefit to society when it leads
people to look abroad for the source of evils which exist at home.

4. Without cleanliness, within and without your house, ventilation is comparatively useless. In certain foul districts of London, poor people used to object to open their windows and doors because of the foul smells that came in. Rich people like to have their stables and dunghill near their houses. But does it ever occur to them that with many arrangements of this kind it would be safer to keep the windows shut than open? You cannot have the air of the house pure with dung-heaps under the windows. These are common all over London. And yet people are surprised that their children, brought up in large "well-aired" nurseries and bed-rooms suffer from children’s epidemics. If they studied Nature’s laws in the matter of children’s health, they would not be so surprised.

There are other ways of having filth inside a house besides having dirt in heaps. Old papered walls of years’ standing, dirty carpets, uncleaned furniture, are just as ready sources of impurity to the air as if there were a dung-heap in the basement. People are so unaccustomed from education and habits to consider how to make a home healthy, that they either never think of it at all, and take every disease as a matter of course, to be "resigned to" when it comes "as from the hand of Providence;" or if they ever entertain the idea of preserving the health of their household as a duty, they are very apt to commit all kinds of "negligences and ignorances" in performing it.

5. A dark house is always an unhealthy house, always an ill-aired house, always a dirty house. Want of light stops growth, and promotes scrofula, rickets, &c., among the children.

People lose their health in a dark house, and if they get ill they cannot get well again in it. More will be said about this farther on.

Three out of many "negligences and ignorances" in managing the health of houses generally, I will here mention as specimens — 1. That the female head in charge of any building does not think it necessary to visit every hole and corner of it every day. How can she expect those who are under her to be more careful to maintain her house in a healthy condition than she who is in charge of it? — 2. That it is not considered essential to air, to sun, and to
clean rooms while uninhabited; which is simply ignoring the first elementary notion of sanitary things, and laying the ground ready for all kinds of diseases. — 3. That the window, and one window, is considered enough to air a room. Have you never observed that any room without a fire-place is always close? And, if you have a fire-place, would you cram it up not only with a chimney-board, but perhaps with a great wisp of brown paper, in the throat of the chimney — to prevent the soot from coming down, you say? If your chimney is foul, sweep it; but don't expect that you can ever air a room with only one aperture; don't suppose that to shut up a room is the way to keep it clean. It is the best way to foul the room and all that is in it. Don't imagine that if you, who are in charge, don't look to all these things yourself, those under you will be more careful than you are. It appears as if the part of a mistress now is to complain of her servants, and to accept their excuses — not to show them how there need be neither complaints made nor excuses.

But again, to look to all these things yourself does not mean to do them yourself. "I always open the windows," the head in charge often says. If you do it, it is by so much the better, certainly, than if it were not done at all. But can you not insure that it is done when not done by yourself? Can you insure that it is not undone when your back is turned? This is what being "in charge" means. And a very important meaning it is, too. The former only implies that just what you can do with your own hands is done. The latter that what ought to be done is always done.

And now, you think these things trifles, or at least exaggerated. But what you "think" or what I "think" matters little. Let us see what God thinks of them. God always justifies His ways. While we are thinking, he has been teaching. I have known cases of hospital pyaemia quite as severe in handsome private houses as in any of the worst hospitals, and from the same cause, viz., foul air. Yet nobody learnt the lesson. Nobody learnt any thing at all from it. They went on thinking — thinking that the sufferer scratched his thumb, or that it was singular that "all the servants" had "whitlows" or that something was "much about this year; there is always sickness in our house." This is a favorite mode of thought — leading not
to inquire what is the uniform cause of these general "whitlows," but to stifle all inquiry. In what sense is "sickness" being "always there," a justification of its being "there" at all?

I will tell you what was the cause of this hospital pyæmia being in that large private house. It was that the sewer air from an ill-placed sink was carefully conducted into all the rooms by sedulously opening all the doors, and closing all the passage windows. It was that the slops were emptied into the foot-pans! — it was that the utensils were never properly rinsed; — it was that the chamber crockery was rinsed with dirty water; — it was that the beds were never properly shaken, aired, picked to pieces, or changed. It was that the carpets and curtains were always musty; — it was that the furniture was always dusty; — it was that the papered walls were saturated with dirt; — it was that the floors were never cleaned; — it was that the uninhabited rooms were never sunned, or cleaned, or aired; — it was that the cupboards were always reservoirs of foul air; — it was that the windows were always tight shut up at night; — it was that no window was ever systematically opened even in the day, or that the right window was not opened. A person gasping for air might open a window for himself. But the servants were not taught to open the windows, to shut the doors; or they opened the windows upon a dank well between high walls, not upon the airier court; or they opened the room doors into the unaired halls and passages, by way of airing the rooms. Now all this is not fancy, but fact. In that handsome house I have known in one summer three cases of hospital pyæmia, one of phlebitis, two of consumptive cough; all the immediate products of foul air. When, in temperate climates, a house is more unhealthy in summer than in winter, it is a certain sign of something wrong. Yet nobody learns the lesson. Yes, God always justifies His ways. He is teaching while you are not learning. This poor body loses his finger, that one loses his life. And all from the most easily preventable causes.*

*I must say a word about servants' bed-rooms. From the way they are built, but oftener from the way they are kept, and from no intelligent inspection whatever being exercised over them, they are almost invariably dens of foul air, and the "servants' health" suffers in an "unaccountable" (?) way, even in the country. For I am by no
The houses of the grandmothers and great grandmothers of this generation, at least the country houses, with front door and back door always standing open, winter and summer, and a thorough draught always blowing through — with all the scrubbing, and cleaning, and polishing, and scouring which used to go on, the grandmothers, and still more the great grandmothers, always out of doors and never with a bonnet on except to go to church, these things entirely account for the fact so often seen of a great grandmother, who was a tower of physical vigor, descending into a grandmother perhaps a little less vigorous but still sound as a bell and healthy to the core, into a mother languid and confined to her carriage and house, and lastly into a daughter sickly and confined to her bed. For, remember, even with a general decrease of mortality, you may often find a race thus degenerating and still offener a family. You may see poor little feeble washed-out rags, children of a noble stock, suffering morally and physically, throughout their useless, degenerate lives, and yet people who are going to marry and to bring more such into the world, will consult nothing but their own convenience as to where they are to live, or how they are to live.

With regard to the health of houses where there is a sick person, it often happens that the sick room is made a ventilating shaft for the rest of the house. For while the house is kept as close, unaired, and dirty as usual, the window of the sick room is kept a little open always, and the door occasionally. Now, there are certain sacrifices which a house with one sick person in it does make to that sick person: it ties up its knocker; it lays straw before it in the street. Why can't it keep itself thoroughly clean and unusually well aired, in deference to the sick person?

We must not forget what, in ordinary language, is called "Infection;"* — a thing of which people are generally so

---

* Is it not living in a continual mistake to look upon diseases, as we
afraid that they frequently follow the very practice in regard to it which they ought to avoid. Nothing used to be considered so infectious or contagious as small-pox; and people not very long ago used to cover up patients with heavy bed clothes, while they kept up large fires and shut the windows. Small-pox, of course, under this *regime*, is very "infectious." People are somewhat wiser now in their management of this disease. They have ventured to cover the patients lightly and to keep the windows open; and we hear much less of the "infection" of small-pox than we used to do. But do people in our days act with more wisdom on the subject of "infection" in fevers—scarlet fever, measles, &c.—than their forefathers did with small-pox? Does not the popular idea of "infection" involve that people should take greater care of themselves than of the patient? that, for instance, it is safer not to be too much with the patient, not to attend too much to his wants? Perhaps the best illustration of the utter absurdity of this view of duty in attending on "infectious" diseases is afforded by what was very recently the practice, if it is not so even now, in some of the European lazarets—in which the plague-patient used to be condemned to the horrors of

do now, as separate entities, which *must* exist, like cats and dogs? instead of looking upon them as conditions, like a dirty and a clean condition, and just as much under our own control; or rather as the reactions of kindly nature, against the conditions in which we have placed ourselves.

I was brought up, both by scientific men and ignorant women, distinctly to believe that small-pox, for instance, was a thing of which there was once a first specimen in the world, which went on propagating itself, in a perpetual chain of descent, just as much as that there was a first dog, (or a first pair of dogs,) and that small-pox would not begin itself any more than a new dog would begin without there having been a parent dog.

Since then I have seen with my eyes and smelt with my nose small-pox growing up in first specimens, either in close rooms, or in overcrowded wards, where it could not by any possibility have been "caught," but must have begun.

Nay, more, I have seen diseases begin, grow up, and pass into one another. Now, dogs do not pass into cats.

I have seen, for instance, with a little overcrowding, continued fever grow up; and with a little more, typhoid fever; and with a little more, typhus, and all in the same ward or hut.

Would it not be far better, truer, and more practical, if we looked upon disease in this light?

For diseases, as all experience shows, are adjectives, not noun substantives.
filth, overcrowding, and want of ventilation, while the medical attendant was ordered to examine the patient's tongue through an opera-glass and to toss him a lancet to open his abscesses with!

True nursing ignores infection, except to prevent it. Cleanliness and fresh air from open windows, with unremitting attention to the patient, are the only defence a true nurse either asks or needs.

Wise and humane management of the patient is the best safeguard against infection.

There are not a few popular opinions, in regard to which it is useful at times to ask a question or two. For example, it is commonly thought that children must have what are commonly called "children's epidemics," "current contagions," &c., in other words, that they are born to have measles, hooping-cough, perhaps even scarlet fever, just as they are born to cut their teeth, if they live.

Now, do tell us, why must a child have measles?

O, because, you say, we cannot keep it from infection—other children have measles—and it must take them—and it is safer that it should.

But why must other children have measles? And if they have, why must yours have them too?

If you believed in and observed the laws for preserving the health of houses which inculcate cleanliness, ventilation, white-washing, and other means, and which, by the way, are laws, as implicitly as you believe in the popular opinion, for it is nothing more than an opinion, that your child must have children's epidemics, don't you think that upon the whole your child would be more likely to escape altogether?

III. PETTY MANAGEMENT.

All the results of good nursing, as detailed in these notes, may be spoiled or utterly negatived by one defect, viz.: in petty management, or in other words, by not knowing how to manage that what you do when you are there, shall be done when you are not there. The most devoted friend or nurse cannot be always there. Nor is it desirable that she should. And she may give up her health, all her other duties, and yet, for want of a little management, be not one-half so efficient as another who is not
one-half so devoted, but who has this art of multiplying
herself—that is to say, the patient of the first will not
really be so well cared for, as the patient of the second.
It is as impossible in a book to teach a person in charge
of sick how to manage, as it is to teach her how to nurse.
Circumstances must vary with each different case. But it
is possible to press upon her to think for herself: Now
what does happen during my absence? I am obliged to
be away on Tuesday. But fresh air, or punctuality, is not
less important to my patient on Tuesday than it was on
Monday. Or: At 10 p.m. I am never with my patient;
but quiet is of no less consequence to him at 10 than it
was at 5 minutes to 10.
Curious as it may seem, this very obvious consideration
occurs comparatively to few; or, if it does occur, it is only
to cause the devoted friend or nurse to be absent fewer
hours or fewer minutes from her patient—not to arrange
so as that no minute and no hour shall be for her patient
without the essentials of her nursing.
A very few instances will be sufficient, not as precepts,
but as illustrations.
A strange washerwoman, coming late at night for the
"things," will burst in by mistake to the patient's sick-
room, after he has fallen into his first doze, giving him a
shock, the effects of which are irremediable, though he
himself laughs at the cause, and probably never even men-
tions it. The nurse who is, and is quite right to be, at her
supper, has not provided that the washerwoman shall not
lose her way and go into the wrong room.
The patient's room may always have the window open.
But the passage outside the patient's room, though pro-
vided with several large windows, may never have one
open. Because it is not understood that the charge of the
sick-room extends to the charge of the passage. And thus,
as often happens, the nurse makes it her business to turn
the patient's room into a ventilating shaft for the foul air of
the whole house.
An uninhabited room, a newly-painted room,* an un-

* That excellent paper, the Builder, mentions the lingering of the
smell of paint for a month about a house as a proof of want of ventila-
tion. Certainly—and, where there are ample windows to open, and
these are never opened to get rid of the smell of paint, it is a proof of
want of management in using the means of ventilation. Of course the
smell will then remain for months. Why should it go?
cleaned closet or cupboard, may often become the reser-
voir of foul air for the whole house, because the person in
charge never thinks of arranging that these places shall
be always aired, always cleaned; she merely opens the
window herself "when she goes in."

An agitating letter or message may be delivered, or an
important letter or message not delivered; a visitor whom
it was of consequence to see, may be refused, or one whom
it was of still more consequence to not see may be admitted
—because the person in charge has never asked herself
this question, What is done when I am not there?*

At all events, one may safely say, a nurse cannot be
with the patient, open the door, eat her meals, take a mes-
 sage, all at one and the same time. Nevertheless the per-
son in charge never seems to look the impossibility in the
face.

Add to this that the attempting this impossibility does
more to increase the poor patient's hurry and nervousness
than anything else.

It is never thought that the patient remembers these
things if you do not. He has not only to think whether
the visit or letter may arrive, but whether you will be in
the way at the particular day and hour when it may arrive.
So that your partial measures for "being in the way" your-
self, only increase the necessity for his thought. Whereas,
if you could but arrange that the thing should always be
done whether you are there or not, he need never think
at all about it.

For the above reasons, whatever a patient can do for

* Why should you let your patient ever be surprised, except by
thieves? I do not know. In England, people do not come down the
chimney, or through the window, unless they are thieves. They come
in by the door, and somebody must open the door to them. The
"somebody" charged with opening the door is one of two, three, or
at most four persons. Why cannot these, at most, four persons be
put in charge as to what is to be done when there is a ring at the
door-bell?

The sentry at a post is changed much oftener than any servant at a
private house or institution can possibly be. But what should we
think of such an excuse as this: that the enemy had entered such a
post because A and not B had been on guard? Yet I have constantly
heard such an excuse made in the private house or institution, and
accepted: viz., that such a person had been "let in" or not "let in,"
and such a parcel had been wrongly delivered or lost because A and
not B had opened the door!
himself, it is better, i. e., less anxiety, for him to do for himself; unless the person in charge has the spirit of management.

It is evidently much less exertion for a patient to answer a letter for himself by return of post, than to have four conversations, wait five days, have six anxieties before it is off his mind, before the person who has to answer it has done so.

Apprehension, uncertainty, waiting, expectation, fear of surprise, do a patient more harm than any exertion. Remember, he is face to face with his enemy all the time, internally wrestling with him, having long imaginary conversations with him. You are thinking of something else. "Rid him of his adversary quickly," is a first rule with the sick.*

For the same reasons, always tell a patient and tell him beforehand when you are going out and when you will be back, whether it is for a day, an hour, or ten minutes. You fancy perhaps that it is better for him if he does not find out your going at all, better for him if you do not make yourself "of too much importance" to him; or else you cannot bear to give him the pain or the anxiety of the temporary separation.

No such thing. You ought to go we will suppose. Health or duty requires it. Then say so to the patient openly. If you go without his knowing it, and he finds it out, he never will feel secure again that the things which depend upon you will be done when you are away, and in nine cases out of ten he will be right. If you go out without telling him when you will be back, he can take no measures nor precautions as to the things which concern you both, or which you do for him.

If you look into the reports of trials or accidents, and especially of suicides, or into the medical history of fatal cases, it is almost incredible how often the whole thing turns upon something which has happened because "he,"

* There are many physical operations where ceteris paribus the danger is in a direct ratio to the time the operation lasts; and ceteris paribus the operator's success will be in direct ratio to his quickness. Now there are many mental operations where exactly the same rule holds good with the sick; ceteris paribus their capability of bearing such operations depends directly on the quickness, without hurry, with which they can be got through.
or still oftener "she," "was not there." But it is still more incredible how often, how almost always this is accepted as a sufficient reason, a justification; why, the very fact of the thing having happened is the proof of its not being a justification. The person in charge was quite right not to be "there," he was called away for quite sufficient reason, or he was away for a daily recurring and unavoidable cause; yet no provision was made to supply his absence. The fault was not in his "being away," but in there being no management to supplement his "being away." When the sun is under a total eclipse or during his nightly absence, we light candles. But it would seem as if it did not occur to us that we must also supplement the person in charge of sick or of children, whether under an occasional eclipse or during a regular absence.

In institutions where many lives would be lost and the effect of such want of management would be terrible and patent, there is less of it than in the private house.*

* So true is this that I could mention two cases of women of very high position, both of whom died in the same way of the consequences of a surgical operation. And in both cases, I was told by the highest authority that the fatal result would not have happened in a London hospital.

But, as far as regards the art of petty management in hospitals, all the military hospitals I know must be excluded. Upon my own experience I stand, and I solemnly declare that I have seen or known of fatal accidents, such as suicides in delirium tremens, bleedings to death, dying patients dragged out of bed by drunken Medical Staff Corps men, and many other things less patent and striking, which would not have happened in London civil hospitals nursed by women. The medical officers should be absolved from all blame in these accidents. How can a medical officer mount guard all day and all night over a patient (say) in delirium tremens? The fault lies in there being no organized system of attendance. Were a trustworthy man in charge of each ward, or set of wards, not as office clerk, but as head nurse, (and head nurse the best hospital ser\gant, or ward master, is not now and cannot be, from default of the proper regulations,) the thing would not, in all probability, have happened. But were a trustworthy woman in charge of the ward, or set of wards, the thing would not, in all certainty, have happened. In other words, it does not happen where a trustworthy woman is really in charge. And, in these remarks, I by no means refer only to exceptional times of great emergency in war hospitals, but also, and quite as much, to the ordinary run of military hospitals at home, in time of peace; or to a time in war when our army was actually more healthy than at home in peace, and the pressure on our hospitals consequently much less.

It is often said that, in regimental hospitals, patients ought to
But in both, let whoever is in charge keep this simple question in her head (not, how can I always do this right thing myself, but) how can I provide for this right thing to be always done?

Then, when anything wrong has actually happened in consequence of her absence, which absence we will suppose to have been quite right, let her question still be (not, how can I provide against any more of such absences? which is neither possible nor desirable, but) how can I provide against anything wrong arising out of my absence?

How few men, or even women, understand, either in great or in little things, what it is the "being in charge"—I mean know how to carry out a "charge." From the most colossal calamities, down to the most trifling accidents, results are often traced (or rather not traced) to such want of some one "in charge" or of his knowing how to be "in charge." A short time ago the bursting of a funnel-casing on board the finest and strongest ship that ever was built, on her trial trip, destroyed several lives and put several hundreds in jeopardy—not from any undetected flaw in her new and untried works—but from a tap being closed which ought not to have been closed—from what every child knows would make its mother's tea-kettle burst. And

"nurse each other," because the number of sick altogether being, say, but thirty, and out of these one only perhaps being seriously ill, and the other twenty-nine having little the matter with them, and nothing to do, they should be set to nurse the one; also, that soldiers are so trained to obey, that they will be the most obedient, and therefore the best of nurses, add to which they are always kind to their comrades.

Now, have those who say this, considered that, in order to obey, you must know how to obey, and that these soldiers certainly do not know how to obey in nursing. I have seen these "kind" fellows (and how kind they are no one knows so well as myself) move a comrade so that, in one case at least, the man died in the act. I have seen the comrades' "kindness" produce abundance of spirits, to be drunk in secret. Let no one understand by this that female nurses ought to, or could be introduced in regimental hospitals. It would be most undesirable, even were it not impossible. But the head nurseship of a hospital sergeant is the more essential, the more important, the more inexperienced the nurses. Undoubtedly, a London hospital "sister" does sometimes set relays of patients to watch a critical case; but, undoubtedly also, always under her own superintendence; and she is called to whenever there is something to be done, and she knows how to do it. The patients are not left to do it of their own unassisted genius, however "kind" and willing they may be.
this simply because no one seemed to know what it is to
be "in charge," or who was in charge. Nay more, the jury
at the inquest actually altogether ignored the same, and
apparently considered the tap "in charge," for they gave
as a verdict "accidental death."

This is the meaning of the word, on a large scale. On
a much smaller scale, it happened, a short time ago, that
an insane person burned herself slowly and intentionally
to death, while in her doctor's charge, and almost in her
nurse's presence. Yet neither was considered "at all to
blame." The very fact of the accident happening proves
its own case. There is nothing more to be said. Either
they did not know their business or they did not know
how to perform it.

To be "in charge" is certainly not only to carry out the
proper measures yourself but to see that every one else
does so too; to see that no one either wilfully or igno-
rantly thwarts or prevents such measures. It is neither to
do everything yourself nor to appoint a number of people to
each duty, but to ensure that each does that duty to which
he is appointed. This is the meaning which must be at-
tached to the word by (above all) those "in charge" of
sick, whether of numbers or of individuals, (and indeed I
think it is with individual sick that it is least understood.
One sick person is often waited on by four with less pre-
cision, and is really less cared for than ten who are waited
on by one; or at least than forty who are waited on by
four; and all for want of this one person "in charge.")

It is often said that there are few good servants now; I
say there are few good mistresses now. As the jury seems
to have thought the tap was in charge of the ship's safety;
so mistresses now seem to think the house is in charge of
itself. They neither know how to give orders, nor how to
 teach their servants to obey orders—i. e., to obey intelli-
gently, which is the real meaning of all discipline.

Again, people who are in charge often seem to have a
pride in feeling that they will be "missed," that no one
can understand or carry on their arrangements, their system,
books, accounts, &c., but themselves. It seems to me that
the pride is rather in carrying on a system, in keeping
stores, closets, books, accounts, &c., so that any body can
understand and carry them on—so that, in case of absence
or illness, one can deliver everything up to others and
know that all will go on as usual, and that one shall never be missed.

Note.—It is often complained, that professional nurses, brought into private families, in case of sickness, make themselves intolerable by "ordering about" the other servants, under plea of not neglecting the patient. Both things are true; the patient is often neglected, and the servants are often unfairly "put upon." But the fault is generally in the want of management of the head in charge. It is surely for her to arrange both that the nurse's place is, when necessary, supplemented, and that the patient is never neglected—things with a little management quite compatible, and indeed only attainable together. It is certainly not for the nurse to "order about" the servants.

IV. Noise.

Unnecessary noise, or noise that creates an expectation in the mind, is that which hurts a patient. It is rarely the loudness of the noise, the effect upon the organ of the ear itself, which appears to affect the sick. How well a patient will generally bear, e. g., the putting up of a scaffolding close to the house, when he cannot bear the talking, still less the whispering, especially if it be of a familiar voice, outside his door.

There are certain patients, no doubt, especially where there is slight concussion or other disturbance of the brain, who are affected by mere noise. But intermittent noise, or sudden and sharp noise, in these, as in all other cases, affects far more than continuous noise—noise with jar far more than noise without. Of one thing you may be certain, that anything which wakes a patient suddenly out of his sleep will invariably put him into a state of greater excitement, do him more serious, aye, and lasting mischief, than any continuous noise, however loud.

Never to allow a patient to be waked, intentionally or accidentally, is a sine qua non of all good nursing. If he is roused out of his first sleep, he is almost certain to have no more sleep. It is a curious but quite intelligible fact that, if a patient is waked after a few hours' instead of a few minutes' sleep, he is much more likely to sleep again. Because pain, like irritability of brain, perpetuates and intensifies itself. If you have gained a respite of either in sleep you have gained more than the mere respite. Both the probability of recurrence and of the same intensity
will be diminished; whereas both will be terribly increased by want of sleep. This is the reason why sleep is so all-important. This is the reason why a patient waked in the early part of his sleep loses not only his sleep, but his power to sleep. A healthy person who allows himself to sleep during the day will lose his sleep at night. But it is exactly the reverse with the sick generally; the more they sleep, the better will they be able to sleep.

I have often been surprised at the thoughtlessness, (resulting in cruelty, quite unintentionally) of friends or of doctors who will hold a long conversation just in the room or passage adjoining to the room of the patient, who is either every moment expecting them to come in, or who has just seen them, and knows they are talking about him. If he is an amiable patient, he will try to occupy his attention elsewhere and not to listen—and this makes matters worse—for the strain upon his attention and the effort he makes are so great that it is well if he is not worse for hours after. If it is a whispered conversation in the same room, then it is absolutely cruel; for it is impossible that the patient's attention should not be involuntarily strained to hear. Walking on tip-toe, doing anything in the room very slowly, are injurious, for exactly the same reasons. A firm, light, quick step, a steady quick hand, are the desiderata; not the slow, lingering, shuffling foot, the timid, uncertain touch. Slowness is not gentleness, though it is often mistaken for such: quickness, lightness, and gentleness are quite compatible. Again, if friends and doctors did but watch, as nurses can and should watch, the features sharpening, the eyes growing almost wild, of fever patients who are listening for the entrance from the corridor of the persons whose voices they are hearing there, these would never run the risk again of creating such expectation, or irritation of mind. Such unnecessary noise has undoubtedly induced or aggravated delirium in many cases. I have known such—in one case death ensued. It is but fair to say that this death was attributed to fright. It was the result of a long whispered conversation, within sight of the patient, about an impending operation; but any one who has known the more than stoicism, the cheerful coolness, with which the certainty of an operation will be accepted by any patient, capable of bearing an operation at all, if it is properly communicated to him, will hesitate to
believe that it was mere fear which produced, as was averred, the fatal result in this instance. It was rather the uncertainty, the strained expectation as to what was to be decided upon.

I need hardly say that the other common cause, namely, for a doctor or friend to leave the patient and communicate his opinion on the result of his visit to the friends just outside the patient's door, or in the adjoining room, after the visit, but within hearing or knowledge of the patient is, if possible, worst of all.

It is, I think, alarming, peculiarly at this time, when the female ink-bottles are perpetually impressing upon us "woman's" "particular worth and general missionariness," to see that the dress of women is daily more and more un-fitting them for any "mission," or usefulness at all. It is equally unfitted for all poetic and all domestic purposes. A man is now a more handy and far less objectionable being in a sick room than a woman. Compelled by her dress, every woman now either shuffles or waddles — only a man can cross the floor of a sick-room without shaking it! What is become of woman's light step? — the firm, light, quick step we have been asking for?

Unnecessary noise, then, is the most cruel absence of care which can be inflicted either on sick or well. For, in all these remarks, the sick are only mentioned as suffering in a greater proportion than the well from precisely the same causes.

Unnecessary (although slight) noise injures a sick person much more than necessary noise (of a much greater amount.)

All doctrines about mysterious affinities and aversions will be found to resolve themselves very much, if not entirely, into presence or absence of care in these things.

A nurse who rustles (I am speaking of nurses professional and unprofessional) is the horror of a patient, though perhaps he does not know why.

The fidget of silk and of crinoline, the rattling of keys, the creaking of stays and of shoes, will do a patient more harm than all the medicines in the world will do him good.

The noiseless step of woman, the noiseless drapery of woman, are mere figures of speech in this day. Her skirts (and well if they do not throw down some piece of furni-
ture) will at least brush against every article in the room as she moves.*

Again, one nurse cannot open the door without making everything rattle. Or she opens the door unnecessarily often, for want of remembering all the articles that might be brought in at once.

A good nurse will always make sure that no door or window in her patient's room shall rattle or creak; that no blind or curtain shall, by any change of wind through the open window be made to flap—especially will she be careful of all this before she leaves her patients for the night. If you wait till your patients tell you, or remind you of these things, where is the use of their having a nurse? There are more shy than exacting patients, in all classes; and many a patient passes a bad night, time after time, rather than remind his nurse every night of all the things she has forgotten.

If there are blinds to your windows, always take care to have them well up, when they are not being used. A little piece slipping down, and flapping with every draught, will distract a patient.

All hurry or bustle is peculiarly painful to the sick. And when a patient has compulsory occupations to engage him, instead of having simply to amuse himself, it becomes doubly injurious. The friend who remains standing and fidgetting about while a patient is talking business to him, or the friend who sits and proses, the one from an idea of not letting the patient talk, the other from an idea of amusing him,—each is equally inconsiderate. Always sit down when a sick person is talking business to you, show no signs of hurry; give complete attention and full consid-

* Fortunate it is if her skirts do not catch fire—and if the nurse does not give herself up a sacrifice together with her patient, to be burnt in her own petticoats. I wish the Registrar-General would tell us the exact number of deaths by burning occasioned by this absurd and hideous custom. But if people will be stupid, let them take measures to protect themselves from their own stupidity—measures which every chemist knows, such as putting alum into starch, which prevents starched articles of dress from blazing up.

I wish, too, that people who wear crinoline could see the indecency of their own dress as other people see it. A respectable elderly woman stooping forward, invested in crinoline, exposes quite as much of her own person to the patient lying in the room as any opera dancer does on the stage. But no one will ever tell her this unpleasant truth.
eration if your advice is wanted, and go away the moment the subject is ended.

Always sit within the patient's view, so that when you speak to him he has not painfully to turn his head round in order to look at you. Every body involuntarily looks at the person speaking. If you make this act a wearisome one on the part of the patient you are doing him harm. So also if by continuing to stand you make him continuously raise his eyes to see you. Be as motionless as possible, and never gesticulate in speaking to the sick.

Never make a patient repeat a message or request, especially if it be some time after. Occupied patients are often accused of doing too much of their own business. They are instinctively right. How often you hear the person charged with the request of giving the message or writing the letter, say half an hour afterwards to the patient, "Did you appoint 12 o'clock?" or, "What did you say was the address?" or ask perhaps some much more agitating question—thus causing the patient the effort of memory, or, worse still, of decision, all over again. It is really less exertion to him to write his letters himself. This is the almost universal experience of occupied invalids.

This brings us to another caution. Never speak to an invalid from behind, nor from the door, nor from any distance from him, nor when he is doing anything.

The official politeness of servants in these things is so grateful to invalids, that many prefer, without knowing why, having none but servants about them.

These things are not fancy. If we consider that, with sick as with well, every thought decomposes some nervous matter,—that decomposition as well as re-composition of nervous matter is always going on, and more quickly with the sick than with the well,—that, to obtrude abruptly another thought upon the brain while it is in the act of destroying nervous matter by thinking, is calling upon it to make a new exertion,—if we consider these things, which are facts, not fancies, we shall remember that we are doing positive injury by interrupting, by "startling a fanciful" person, as it is called. Alas! it is no fancy.

If the invalid is forced, by his avocations, to continue occupations requiring much thinking, the injury is doubly great. In feeding a patient suffering under delirium or stupor you may suffocate him, by giving him his food sud.
denly, but if you rub his lips gently with a spoon and thus attract his attention, he will swallow the food unconsciously, but with perfect safety. Thus it is with the brain. If you offer it a thought, especially one requiring a decision, abruptly, you do it a real not fanciful injury. Never speak to a sick person suddenly; but, at the same time, do not keep his expectation on the tip-toe.

This rule, indeed, applies to the well quite as much as to the sick. I have never known persons who exposed themselves for years to constant interruption who did not muddle away their intellects by it at last. The process with them may be accomplished without pain. With the sick, pain gives warning of the injury.

Do not meet or overtake a patient who is moving about in order to speak to him, or to give him any message or letter. You might just as well give him a box on the ear. I have seen a patient fall flat on the ground who was standing when his nurse came into the room. This was an accident which might have happened to the most careful nurse. But the other is done with intention. A patient in such a state is not going to the East Indies. If you would wait ten seconds, or walk ten yards further, any promenade he could make would be over. You do not know the effort it is to a patient to remain standing for even a quarter of a minute to listen to you. If I had not seen the thing done by the kindest nurses and friends, I should have thought this caution quite superfluous.*

Patients are often accused of being able to "do much more when nobody is by." It is quite true that they can. Unless nurses can be brought to attend to considerations of the kind of which we have given here but a few specimens,

* It is absolutely essential that a nurse should lay this down as a positive rule to herself, never to speak to any patient who is standing or moving, as long as she exercises so little observation as not to know when a patient cannot bear it. I am satisfied that many of the accidents which happen from feeble patients tumbling down stairs, fainting after getting up, &c., happen solely from the nurse popping out of a door to speak to the patient just at that moment; or from his fearing that she will do so; and that if the patient were even left to himself till he can sit down, such accidents would much seldomer occur. If the nurse accompanies the patient, let her not call upon him to speak. It is incredible that nurses cannot picture to themselves the strain upon the heart, the lungs, and the brain, which the act of moving is to any feeble patient.
a very weak patient finds it really much less exertion to do things for himself than to ask for them. And he will, in order to do them, (very innocently and from instinct) calculate the time his nurse is likely to be absent from a fear of her "coming in upon" him or speaking to him, just at the moment when he finds it quite as much as he can do to crawl from his bed to his chair, or from one room to another, or down stairs, or out of doors for a few minutes. Some extra call made upon his attention at that moment will quite upset him. In these cases you may be sure that a patient in the state we have described does not make such exertions more than once or twice a day, and probably much about the same hour every day. And it is hard, indeed, if nurse and friends cannot calculate so as to let him make them undisturbed. Remember, that many patients can walk who cannot stand or even sit up. Standing is, of all positions, the most trying to a weak patient.

Everything you do in a patient's room after he is "put up" for the night, increases tenfold the risk of his having a bad night. But, if you rouse him up after he has fallen asleep, you do not risk, you secure him a bad night.

One hint I would give to all who attend or visit the sick, to all who have to pronounce an opinion upon sickness or its progress. Come back and look at your patient after he has had an hour's animated conversation with you. It is the best test of his real state we know. But never pronounce upon him from merely seeing what he does, or how he looks, during such a conversation. Learn also carefully and exactly, if you can, how he passed the night after it.

People rarely, if ever, faint while making an exertion. It is after it is over. Indeed, almost every effect of over-exertion appears after, not during such exertion. It is the highest folly to judge of the sick, as is so often done, when you see them merely during a period of excitement. People have very often died of that which, it has been proclaimed at the time, has "done them no harm."*

* As an old experienced nurse, I do most earnestly deprecate all such careless words. I have known patients delirious all night, after seeing a visitor who called them "better," thought they "only wanted a little amusement," and who came again, saying: "I hope you were not the worse for my visit," neither waiting for an answer, nor even looking at the case. No real patient will ever say, "Yes, but I was a great deal the worse."

It is not, however, either death or delirium of which, in these cases,
Remember never to lean against, sit upon, or unnecessarily shake, or even touch the bed in which a patient lies. This is invariably a painful annoyance. If you shake the chair on which he sits, he has a point by which to steady himself, in his feet. But on a bed or sofa, he is entirely at your mercy, and he feels every jar you give him all through him.

In all that we have said, both here and elsewhere, let it be distinctly understood that we are not speaking of hypochondriacs. To distinguish between real and fancied disease forms an important branch of the education of a nurse. To manage fancy patients forms an important branch of her duties. But the nursing which real and that which fancied patients require is of different, or rather of opposite character. And the latter will not be spoken of here. Indeed, many of the symptoms which are here mentioned are those which distinguish real from fancied disease.

It is true that hypochondriacs very often do that behind a nurse's back which they would not do before her face. Many such I have had as patients who scarcely ate anything at their regular meals; but if you concealed food for them in a drawer, they would take it at night or in secret. But this is from quite a different motive. They do it from the wish to conceal. Whereas the real patient will often boast to his nurse or doctor, if these do not shake their heads at him, of how much he has done, or eaten, or walked. To return to real disease.

Conciseness and decision are, above all things, necessary with the sick. Let your thought expressed to them be concisely and decidedly expressed. What doubt and hesitation there may be in your own mind must never be communicated to theirs, not even (I would rather say especially not) in little things. Let your doubt be to yourself, your decision to them. People who think outside their heads, the whole process of whose thought appears, like Homer's, in the act of secretion, who tell everything there is most danger to the patient. Unperceived consequences are far more likely to ensue. You will have impunity—the poor patient will not. That is, the patient will suffer, although neither he nor the inflictor of the injury will attribute it to its real cause. It will not be directly traceable, except by a very careful, observant nurse. The patient will often not even mention what has done him most harm.
that led them towards this conclusion and away from that, ought never to be with the sick.

Irresolution is what all patients most dread. Rather than meet this in others, they will collect all their data, and make up their minds for themselves. A change of mind in others, whether it is regarding an operation, or re-writing a letter, always injures the patient more than the being called upon to make up his mind to the most dreaded or difficult decision. Farther than this, in very many cases, the imagination in disease is far more active and vivid than it is in health. If you propose to the patient change of air to one place one hour, and to another the next, he has, in each case, immediately constituted himself in imagination the tenant of the place, gone over the whole premises in idea, and you have tired him as much by displacing his imagination, as if you had actually carried him over both places.

Above all, leave the sick room quickly and come into it quickly, not suddenly, not with a rush. But don't let the patient be wearily waiting for when you will be out of the room or when you will be in it. Conciseness and decision in your movements, as well as your words, are necessary in the sick room, as necessary as absence of hurry and bustle. To possess yourself entirely will ensure you from either failing—either loitering or hurrying.

If a patient has to see, not only to his own but also to his nurse's punctuality, or perseverance, or readiness, or calmness, to any or all of these things, he is far better without that nurse than with her—however valuable and handy her services may otherwise be to him, and however incapable he may be of rendering them to himself.

With regard to reading aloud in the sick room, my experience is, that when the sick are too ill to read to themselves, they can seldom bear to be read to. Children, eye-patients, and uneducated persons are exceptions, or where there is any mechanical difficulty in reading. People who like to be read to, have generally not much the matter with them; while in fevers, or where there is much irritability of brain, the effort of listening to reading aloud has often brought on delirium. I speak with great diffidence; because there is an almost universal impression that it is sparing the sick to read aloud to them. But two things are certain:
(1.) If there is some matter which must be read to a sick person, do it slowly. People often think that the way to get it over with least fatigue to him is to get it over in least time. They gabble; they plunge and gallop through the reading. There never was a greater mistake. Houdin, the conjuror, says that the way to make a story seem short is to tell it slowly. So it is with reading to the sick. I have often heard a patient say to such a mistaken reader, "Don't read it to me; tell it me."* Unconsciously he is aware that this will regulate the plunging, the reading with unequal paces, slurring over one part, instead of leaving it out altogether, if it is unimportant, and mumbling another. If the reader lets his own attention wander, and then stops to read up to himself, or finds he has read the wrong bit, then it is all over with the poor patient's chance of not suffering. Very few people know how to read to the sick; very few read aloud as pleasantly even as they speak. In reading they sing, they hesitate, they stammer, they hurry, they mumble; when in speaking they do none of these things. Reading aloud to the sick ought always to be rather slow, and exceedingly distinct, but not mouthing—rather monotonous, but not sing song—rather loud, but not noisy—and, above all, not too long. Be very sure of what your patient can bear.

(2.) The extraordinary habit of reading to oneself in a sick room, and reading aloud to the patient any bits which will amuse him or more often the reader, is unaccountably thoughtless. What do you think the patient is thinking of during your gaps of non-reading? Do you think that he amuses himself upon what you have read for precisely the time it pleases you to go on reading to yourself, and that his attention is ready for something else at precisely the time it pleases you to begin reading again? Whether the person thus read to be sick or well, whether he be doing nothing or doing something else while being thus read to, the self-absorption and want of observation of the person who does it, is equally difficult to understand—although very often the readee is too amiable to say how much it hurts him.

* Sick children, if not too shy to speak, will always express this wish. They invariably prefer a story to be told to them rather than read to them.
One thing more:—From the flimsy manner in which most modern houses are built, where every step on the stairs, and along the floors, is felt all over the house; the higher the story, the greater the vibration. It is inconceivable how much the sick suffer by having anybody overhead. In the solidly built old houses, which fortunately, most hospitals are, the noise and shaking is comparatively trifling. But it is a serious cause of suffering, in lightly built houses, and with the irritability peculiar to some diseases. Better far put such patients at the top of the house, even with the additional fatigue of stairs, if you cannot secure the room above them being untenanted; you may otherwise bring on a state of restlessness which no opium will subdue. Do not neglect the warning, when a patient tells you that he "feels every step above him to cross his heart." Remember that every noise a patient cannot see partakes of the character of suddenness to him; and I am persuaded that patients with these peculiarly irritable nerves, are positively less injured by having persons in the same room with them than overhead, or separated by only a thin compartment. Any sacrifice to secure silence for these cases is worth while, because no air, however good, no attendance, however careful, will do anything for such cases without quiet.

Note. — The effect of music upon the sick has been scarcely at all noticed. In fact, its expensiveness, as it is now, makes any general application of it quite out of the question. I will only remark here, that wind instruments, including the human voice, and stringed instruments capable of continuous sound, have generally a beneficent effect; while the piano-forte, with such instruments as have no continuity of sound, has just the reverse. The finest piano-forte playing will damage the sick, while an air, like "Home, sweet home," or "Assisa a piè d'un salice," on the most ordinary grinding organ, will sensibly soothe them — and this quite independent of association.

V. VARIETY.

To any but an old nurse, or an old patient, the degree would be quite inconceivable to which the nerves of the sick suffer from seeing the same walls, the same ceiling, the same surroundings during a long confinement to one or two rooms.
The superior cheerfulness of persons suffering severe paroxysms of pain over that of persons suffering from nervous debility has often been remarked upon, and attributed to the enjoyment of the former of their intervals of respite. I incline to think that the majority of cheerful cases is to be found among those patients who are not confined to one room, whatever their suffering, and that the majority of depressed cases will be seen among those subjected to a long monotony of objects about them.

The nervous frame really suffers as much from this as the digestive organs from long monotony of diet, as, e. g., the soldier from his twenty-one years' "boiled beef."

The effect in sickness of beautiful objects, of variety of objects, and especially of brilliancy of color, is hardly at all appreciated.

Such cravings are usually called the "fancies" of patients. And often doubtless patients have "fancies," as, e. g., when they desire two contradictions. But much more often, their (so called) "fancies" are the most valuable indications of what is necessary for their recovery. And it would be well if nurses would watch these (so called) "fancies" closely.

I have seen, in fevers, (and felt, when I was a fever patient myself,) the most acute suffering produced from the patient (in a hut) not being able to see out of window, and the knots in the wood being the only view. I shall never forget the rapture of fever patients over a bunch of bright-colored flowers. I remember (in my own case) a nosegay of wild flowers being sent me, and from that moment recovery becoming more rapid.

People say the effect is only on the mind. It is no such thing. The effect is on the body, too. Little as we know about the way in which we are affected by form, by color, and light, we do know this, that they have an actual physical effect.

Variety of form and brilliancy of color in the objects presented to patients are actual means of recovery.

But it must be slow variety, e. g., if you show a patient ten or twelve engravings successively, ten-to-one that he does not become cold and faint, or feverish, or even sick; but hang one up opposite to him, on each successive day, or week, or month, and he will revel in the variety.

The folly and ignorance which reign too often supreme
over the sick-room, cannot be better exemplified than by this. While the nurse will leave the patient stewing in a corrupting atmosphere, the best ingredient of which is carbonic acid, she will deny him, on the plea of unhealthiness, a glass of cut-flowers, or a growing plant. Now, no one ever saw "overcrowding" by plants in a room or ward. And the carbonic acid they give off at nights would not poison a fly. Nay, in overcrowded rooms, they actually absorb carbonic acid and give off oxygen. Cut-flowers also decompose water and produce oxygen gas. It is true there are certain flowers, e. g., the lilies, the smell of which is said to depress the nervous system. These are easily known by the smell, and can be avoided.

Volumes are now written and spoken upon the effect of the mind upon the body. Much of it is true. But I wish a little more was thought of the effect of the body on the mind. You who believe yourselves overwhelmed with anxieties, but are able every day to walk up Regent Street, or out in the country, to take your meals with others in other rooms, &c., &c., you little know how much your anxieties are thereby lightened; you little know how intensified they become to those who can have no change;* how the very walls of their sick rooms seem hung with their cares; how the ghosts of their troubles haunt their beds; how impossible it is for them to escape from a pursuing thought without some help from variety.

A patient can just as much move his leg when it is fractured as change his thoughts when no external help from variety is given him. This is, indeed, one of the main sufferings of sickness; just as the fixed posture is one of the main sufferings of the broken limb.

It is an ever recurring wonder to see educated people,

* It is a matter of painful wonder to the sick themselves, how much painful ideas predominate over pleasurable ones in their impressions. They reason with themselves; they think themselves ungrateful. It is all of no use. The fact is, that these painful impressions are far better dismissed by a real laugh, if you can excite one by books or conversation, than by any direct reasoning; or if the patient is too weak to laugh, some impression from nature is what he wants. I have mentioned the cruelty of letting him stare at a dead wall. In many diseases, especially in convalescence from fever, that wall will appear to make all sorts of faces at him; now flowers never do this. Form, color, will free your patient from his painful ideas better than any argument.
who call themselves nurses, acting thus. They vary their own objects, their own employments, many times a day; and while nursing (!) some bed-ridden sufferer, they let him lie there staring at a dead wall, without any change of object to enable him to vary his thoughts; and it never even occurs to them, at least to move his bed so that he can look out of window. No, the bed is to be always left in the darkest, dullest, remotest part of the room.*

I think it is a very common error among the well to think that, "with a little more self-control," the sick might, if they choose, "dismiss painful thoughts" which "aggravate their disease," &c. Believe me, almost any sick person, who behaves decently well, exercises more self-control every moment of his day than you will ever know till you are sick yourself. Almost every step that crosses his room is painful to him; almost every thought that crosses his brain is painful to him; and if he can speak without being savage, and look without being unpleasant, he is exercising self-control.

Suppose you have been up all night, and instead of being allowed to have your cup of tea, you were to be told that you ought to "exercise self-control," what should you say? Now, the nerves of the sick are always in the state that yours are in after you have been up all night.

We will suppose the diet of the sick to be cared for. Then, this state of nerves is most frequently to be relieved by care in affording them a pleasant view, a judicious va-

* I remember a case in point. A man received an injury to the spine, from an accident, which, after a long confinement, ended in death. He was a workman — had not in his composition a single grain of what is called "enthusiasm for nature" — but he was desperate to "see once more out of window." His nurse actually got him on her back, and managed to perch him up at the window for an instant, "to see out." The consequence to the poor nurse was a serious illness, which nearly proved fatal. The man never knew it; but a great many other people did. Yet the consequence in none of their minds, so far as I know, was the conviction that the craving for variety in the starving eye, is just as desperate as that of food in the starving stomach, and tempts the famishing creature in either case to steal for its satisfaction. No other word will express it but "desperation." And it sets the seal of ignorance and stupidity just as much on the governors and attendants of the sick if they do not provide the sick-bed with a "view" of some kind, as if they did not provide the hospital with a kitchen.
riety as to flowers,* and pretty things. Light by itself will often relieve it. The craving for "the return of day," which the sick so constantly evince, is generally nothing but the desire for light, the remembrance of the relief which a variety of objects before the eye affords to the harassed sick mind.

Again, every man and every woman has some amount of manual employment, excepting a few fine ladies, who do not even dress themselves, and who are virtually in the same category, as to nerves, as the sick. Now, you can have no idea of the relief which manual labor is to you—of the degree to which the deprivation of manual employment increases the peculiar irritability from which many sick suffer.

A little needle-work, a little writing, a little cleaning, would be the greatest relief the sick could have, if they could do it; these are the greatest relief to you, though you do not know it. Reading, though it is often the only thing the sick can do, is not this relief. Bearing this in mind, bearing in mind that you have all these varieties of employment which the sick cannot have, bear also in mind to obtain for them all the varieties which they can enjoy.

I need hardly say that I am well aware that excess in needle-work, in writing, in any other continuous employment, will produce the same irritability that defect in manual employment (as one cause) produces in the sick.

VI. TAKING FOOD.

Every careful observer of the sick will agree in this that thousands of patients are annually starved in the midst of plenty, from want of attention to the ways which alone make it possible for them to take food. This want of attention is as remarkable in those who urge upon the sick to do what is quite impossible to them, as in the sick themselves who will not make the effort to do what is perfectly possible to them.

For instance, to the large majority of very weak patients

* No one who has watched the sick can doubt the fact, that some feel stimulus from looking at scarlet flowers, exhaustion from looking at deep blue, &c.
it is quite impossible to take any solid food before 11 A.M.,
or then, if their strength is still further exhausted by fast-
ing till that hour. For weak patients have generally fe-
verish nights and, in the morning, dry mouths; and, if
they could eat with those dry mouths, it would be the
worse for them. A spoonful of beef-tea, of arrowroot and
wine, of egg flip, every hour, will give them the requisite
nourishment, and prevent them from being too much ex-
hausted to take at a later hour the solid food, which is
necessary for their recovery. And every patient who can
swallow at all can swallow these liquid things, if he
chooses. But how often do we hear a mutton-chop, an
egg, a bit of bacon, ordered to a patient for breakfast, to
whom (as a moment's consideration would show us) it
must be quite impossible to masticate such things at that
hour.

Again, a nurse is ordered to give a patient a tea-cup full
of some article of food every three hours. The patient's
stomach rejects it. If so, try a table-spoon full every
hour; if this will not do, a tea-spoon full every quarter of
an hour.

I am bound to say, that I think more patients are lost
by want of care and ingenuity in these momentous mi-
nutiae in private nursing than in public hospitals. And I
think there is more of the entente cordiale to assist one
another's hands between the doctor and his head nurse in
the latter institutions, than between the doctor and the pa-
tient's friends in the private house.

If we did but know the consequences which may ensue,
in very weak patients, from ten minutes' fasting, or reple-
tion (I call it repletion when they are obliged to let too
small an interval elapse between taking food and some
other exertion, owing to the nurse's unpunctuality), we
should be more careful never to let this occur. In very
weak patients there is often a nervous difficulty of swal-
lowing, which is so much increased by any other call upon
their strength that, unless they have their food punctually
at the minute, which minute again must be arranged so as
to fall in with no other minute's occupation, they can take
nothing till the next respite occurs—so that an unpunctu-
ality or delay of ten minutes may very well turn out to be
one of two or three hours. And why is it not as easy to
be punctual to a minute? Life often literally hangs upon these minutes.

In acute cases, where life or death is to be determined in a few hours, these matters are very generally attended to, especially in hospitals; and the number of cases is large where the patient is, as it were, brought back to life by exceeding care on the part of the doctor or nurse, or both, in ordering and giving nourishment with minute selection and punctuality.

But in chronic cases, lasting over months and years, where the fatal issue is often determined at last by mere protracted starvation, I had rather not enumerate the instances which I have known where a little ingenuity, and a great deal of perseverance, might, in all probability, have averted the result. The consulting the hours when the patient can take food, the observation of the times, often varying, when he is most faint, the altering seasons of taking food, in order to anticipate and prevent such times—all this, which requires observation, ingenuity, and perseverance (and these really constitute the good nurse), might save more lives than we wet of.

To leave the patient's untasted food by his side, from meal to meal, in hopes that he will eat it in the interval is simply to prevent him from taking any food at all. I have known patients literally incapacitated from taking one article of food after another, by this piece of ignorance. Let the food come at the right time, and be taken away, eaten or uneaten, at the right time; but never let a patient have "something always standing" by him, if you don't wish to disgust him of every thing.

On the other hand, I have known a patient's life saved (he was sinking for want of food) by the simple question, put to him by the doctor, "But is there no hour when you feel you could eat?" "O, yes," he said, "I could always take something at — o'clock and — o'clock." The thing was tried and succeeded. Patients very seldom, however, can tell this; it is for you to watch and find it out.

A patient should, if possible, not see or smell either the food of others, or a greater amount of food than he himself can consume at one time, or even hear food talked about or see it in the raw state. I know of no exception to the above rule. The breaking of it always induces a greater or less incapacity of taking food.
TAKING FOOD.

51

In hospital wards it is of course impossible to observe all this; and in single wards, where a patient must be continuously and closely watched, it is frequently impossible to relieve the attendant, so that his or her own meals can be taken out of the ward. But it is not the less true that, in such cases, even where the patient is not himself aware of it, his possibility of taking food is limited by seeing the attendant eating meals under his observation. In some cases the sick are aware of it, and complain. A case where the patient was supposed to be insensible, but complained as soon as able to speak, is now present to my recollection.

Remember, however, that the extreme punctuality in well-ordered hospitals, the rule that nothing shall be done in the ward while the patients are having their meals, go far to counterbalance what unavoidable evil there is in having patients together. I have often seen the private nurse go on dusting or fidgeting about in a sick room all the while the patient is eating, or trying to eat.

That the more alone an invalid can be when taking food, the better, is unquestionable; and, even if he must be fed, the nurse should not allow him to talk, or talk to him, especially about food, while eating.

When a person is compelled, by the pressure of occupation, to continue his business while sick, it ought to be a rule WITHOUT ANY EXCEPTION WHATSOEVER, that no one shall bring business to him or talk to him while he is taking food, nor go on talking to him on interesting subjects up to the last moment before his meals, nor make an engagement with him immediately after, so that there be any hurry of mind while taking them.

Upon the observance of these rules, especially the first, often depends the patient's capability of taking food at all, or, if he is amiable and forces himself to take food, of deriving any nourishment from it.

A nurse should never put before a patient milk that is sour, meat or soup that is turned, an egg that is bad, or vegetables underdone. Yet often I have seen these things brought in to the sick in a state perfectly perceptible to every nose or eye except the nurse's. It is here that the clever nurse appears; she will not bring in the plebeian article, but, not to disappoint the patient, she will whip up something else in a few minutes. Remember that sick
cookery should half do the work of your poor patient's weak digestion. But if you further impair it with your bad articles, I know not what is to become of him or of it.

If the nurse is an intelligent being, and not a mere carrier of diets to and from the patient, let her exercise her intelligence in these things. How often we have known a patient eat nothing at all in the day, because one meal was left untasted (at that time he was incapable of eating), at another the milk was sour, the third was spoiled by some other accident. And it never occurred to the nurse to extemporize some expedient,—it never occurred to her that as he had had no solid food that day he might eat a bit of toast (say) with his tea in the evening, or he might have some meal an hour earlier. A patient who cannot touch his dinner at two, will often accept it gladly, if brought to him at seven. But somehow nurses never "think of these things." One would imagine they did not consider themselves bound to exercise their judgment; they leave it to the patient. Now I am quite sure that it is better for a patient rather to suffer these neglects than to try to teach his nurse to nurse him, if she does not know how. It ruffles him, and if he is ill he is in no condition to teach, especially upon himself. The above remarks apply much more to private nursing than to hospitals.

I would say to the nurse, have a rule of thought about your patient's diet; consider, remember how much he has had, and how much he ought to have to-day. Generally, the only rule of the private patient's diet is what the nurse has to give. It is true she cannot give him what she has not got; but his stomach does not wait for her convenience, or even her necessity.* If it is used to having its stimulus at one hour to-day, and to-morrow it does not have it, because she has failed in getting it, he will suffer.

* Why, because the nurse has not got some food to-day which the patient takes, can the patient wait four hours for food to-day; who could not wait two hours yesterday? Yet this is the only logic one generally hears. On the other hand, the other logic, viz., of the nurse giving a patient a thing because she has got it, is equally fatal. If she happens to have fresh jelly or fresh fruit, she will frequently give it to the patient half an hour after his dinner, or at his dinner, when he cannot possibly eat that and the broth too—or worse still, leave it by his bedside till he is so sickened with the sight of it that he cannot eat it at all.
She must be always exercising her ingenuity to supply defects, and to remedy accidents which will happen among the best contrivers, but from which the patient does not suffer the less, because “they cannot be helped.”

One very minute caution,—take care not to spill into your patient's saucer, in other words, take care that the outside bottom rim of his cup shall be quite dry and clean; if, every time he lifts his cup to his lips, he has to carry the saucer with it, or else to drop the liquid upon, and to soil his sheet, or his bed-gown, or pillow, or if he is sitting up, his dress, you have no idea what a difference this minute want of care on your part makes to his comfort and even to his willingness for food.

VII. WHAT FOOD?

I will mention one or two of the most common errors among women in charge of sick respecting sick diet. One is the belief that beef tea is the most nutritive of all articles. Now, just try and boil down a lb. of beef into beef tea, evaporate your beef tea, and see what is left of your beef. You will find that there is barely a teaspoonful of solid nourishment to half a pint of water in beef tea;—nevertheless there is a certain reparative quality in it, we do not know what, as there is in tea;—but it may safely be given in almost any inflammatory disease, and is as little to be depended upon with the healthy or convalescent where much nourishment is required. Again, it is an ever ready saw that an egg is equivalent to a lb. of meat,—whereas it is not at all so. Also, it is seldom noticed with how many patients, particularly of nervous or bilious temperament, eggs disagree. All puddings made with eggs, are distasteful to them in consequence. An egg whipped up with wine, is often the only form in which they can take this kind of nourishment. Again, if the patient has attained to eating meat, it is supposed that to give him meat is the only thing needful for his recovery; whereas scorbutic sores have been actually known to appear among sick persons living in the midst of plenty in England, which could be traced to no other source than this, viz.: that the nurse, depending on meat alone, had allowed the patient to be without vegetables for a considerable time,
these latter being so badly cooked that he always left them untouched. Arrowroot is another grand dependence of the nurse. As a vehicle for wine, and as a restorative quickly prepared, it is all very well. But it is nothing but starch and water. Flour is both more nutritive, and less liable to ferment, and is preferable wherever it can be used.

Again, milk and the preparations from milk, are a most important article of food for the sick. Butter is the lightest kind of animal fat, and though it wants the sugar and some of the other elements which there are in milk, yet it is most valuable both in itself and in enabling the patient to eat more bread. Flour, oats, groats, barley, and their kind, are, as we have already said, preferable in all their preparations to all the preparations of arrowroot, sago, tapioca, and their kind. Cream, in many long chronic diseases, is quite irreplaceable by any other article whatever. It seems to act in the same manner as beef tea, and to most it is much easier of digestion than milk. In fact, it seldom disagrees. Cheese is not usually digestible by the sick, but it is pure nourishment for repairing waste; and I have seen sick, and not a few either, whose craving for cheese shewed how much it was needed by them.*

But, if fresh milk is so valuable a food for the sick, the least change or sourness in it, makes it of all articles, perhaps, the most injurious; diarrhoea is a common result of fresh milk allowed to become at all sour. The nurse therefore ought to exercise her utmost care in this. In large institutions for the sick, even the poorest, the utmost care is exercised. Wenham Lake ice is used for this express purpose every summer, while the private patient, perhaps, never tastes a drop of milk that is not sour, all through the hot weather, so little does the private nurse understand

* In the diseases produced by bad food, such as scurvy and diarrhoea, the patient’s stomach often craves for and digests things, some of which certainly would be laid down in no dietary that ever was invented for sick, and especially not for such sick. These are fruit, pickles, jams, gingerbread, fat of ham or bacon, suet, cheese, butter, milk. These cases I have seen not by ones, nor by tens, but by hundreds. And the patient’s stomach was right and the book was wrong. The articles craved for, in these cases, might have been principally arranged under the two heads of fat and vegetable acids.

There is often a marked difference between men and women in this matter of sick feeding. Women’s digestion is generally slower.
the necessity of such care. Yet, if you consider that the only drop of real nourishment in your patient's tea is the drop of milk, and how much almost all English patients depend upon, their tea, you will see the great importance of not depriving your patient of this drop of milk. Buttermilk, a totally different thing, is often very useful, especially in fevers.

In laying down rules of diet, by the amounts of "solid nutriment" in different kinds of food, it is constantly lost sight of what the patient requires to repair his waste, what he can take and what he can't. You cannot diet a patient from a book, you cannot make up the human body as you would make up a prescription, — so many parts "carboniferous," so many parts "nitrogenous" will constitute a perfect diet for the patient. The nurse's observation here will materially assist the doctor — the patient's "fancies" will materially assist the nurse. For instance, sugar is one of the most nutritive of all articles, being pure carbon, and is particularly recommended in some books. But the vast majority of all patients in England, young and old, male and female, rich and poor, hospital and private, dislike sweet things, — and while I have never known a person take to sweets when he was ill who disliked them when he was well, I have known many fond of them when in health, who in sickness would leave off any thing sweet, even to sugar in tea, — sweet puddings, sweet drinks, are their aversion; the furred tongue almost always likes what is sharp or pungent. Scorbatic patients are an exception, they often crave for sweetmeats and jams.

Jelly is another article of diet in great favor with nurses and friends of the sick; even if it could be eaten solid, it would not nourish, but it is simply the height of folly to take \( \frac{1}{4} \) oz. of gelatine and make it into a certain bulk by dissolving it in water and then to give it to the sick, as if the mere bulk represented nourishment. It is now known that jelly does not nourish, that it has a tendency to produce diarrhoea, — and to trust to it to repair the waste of a diseased constitution is simply to starve the sick under the guise of feeding them. If 100 spoonfuls of jelly were given in the course of the day, you would have given one spoonful of gelatine, which spoonful has no nutritive power whatever.

And, nevertheless, gelatine contains a large quantity of
nitrogen, which is one of the most powerful elements in nutrition; on the other hand, beef tea may be chosen as an illustration of great nutrient power in sickness, co-existing with a very small amount of solid nitrogenous matter.

Dr. Christison says that "every one will be struck with the readiness with which" certain classes of "patients will often take diluted meat juice or beef tea repeately, when they refuse all other kinds of food." This is particularly remarkable in "cases of gastric fever, in which," he says, "little or nothing else besides beef tea or diluted meat juice" has been taken for weeks or even months, "and yet a pint of beef tea contains scarcely \( \frac{1}{4} \) oz. of anything but water," — the result is so striking that he asks what is its mode of action? "Not simply nutrient — \( \frac{1}{4} \) oz. of the most nutritive material cannot nearly replace the daily wear and tear of the tissues in any circumstances. Possibly," he says, "it belongs to a new denomination of remedies."

It has been observed that a small quantity of beef tea added to other articles of nutrition augments their power out of all proportion to the additional amount of solid matter.

The reason why jelly should be innutritious and beef tea nutritious to the sick, is a secret yet undiscovered, but it clearly shows that careful observation of the sick is the only clue to the best dietary.

Chemistry has as yet afforded little insight into the dieting of sick. All that chemistry can tell us is the amount of "carboniferous" or "nitrogenous" elements discoverable in different dietetic articles. It has given us lists of dietetic substances, arranged in the order of their richness in one or other of these principles; but that is all. In the great majority of cases, the stomach of the patient is guided by other principles of selection than merely the amount of carbon or nitrogen in the diet. No doubt, in this as in other things, nature has very definite rules for her guidance, but these rules can only be ascertained by the most careful observation at the bed-side. She there teaches us that living chemistry, the chemistry of reparation, is something different from the chemistry of the laboratory. Organic chemistry is useful, as all knowledge is, when we come face to face with nature; but it by no
means follows that we should learn in the laboratory any one of the reparative processes going on in disease.

Again, the nutritive power of milk and of the preparations from milk, is very much undervalued; there is nearly as much nourishment in half a pint of milk as there is in a quarter of a lb. of meat. But this is not the whole question or nearly the whole. The main question is what the patient's stomach can assimilate or derive nourishment from, and of this the patient's stomach is the sole judge. Chemistry cannot tell this. The patient's stomach must be its own chemist. The diet which will keep the healthy man healthy, will kill the sick one. The same beef which is the most nutritive of all meat which nourishes the healthy man, is the least nourishing of all food to the sick man, whose half-dead stomach can assimilate no part of it, that is, make no food out of it. On a diet of beef tea healthy men on the other hand speedily lose their strength.

I have known patients live for many months without touching bread, because they could not eat baker's bread. These were mostly country patients, but not all. Homemade bread or brown bread is a most important article of diet for many patients. The use of aperients may be entirely superseded by it. Oat cake is another.

To watch for the opinions, then, which the patient's stomach gives, rather than to read "analyses of foods," is the business of all those who have to settle what the patient is to eat—perhaps the most important thing to be provided for him after the air he is to breathe.

Now the medical man who sees the patient only once a day or even only once or twice a week, cannot possibly tell this without the assistance of the patient himself, or of those who are in constant observation on the patient. The utmost the medical man can tell is whether the patient is weaker or stronger at this visit than he was at the last visit. I should therefore say, that incomparably the most important office of the nurse, after she has taken care of the patient's air, is to take care to observe the effect of his food, and report it to the medical attendant.

It is quite incalculable the good that would certainly come from such sound and close observation in this almost neglected branch of nursing, or the help it would give to the medical man.
A great deal too much against tea* is said by wise people, and a great deal too much of tea is given to the sick by foolish people. When you see the natural and almost universal craving in English sick for their "tea," you cannot but feel that nature knows what she is about. But a little tea or coffee restores them quite as much as a great deal, and a great deal of tea and especially of coffee impairs the little power of digestion they have. Yet a nurse, because she sees how one or two cups of tea or coffee restores her patient, thinks that three or four cups will do twice as much. This is not the case at all; it is however certain that there is nothing yet discovered which is a substitute to the English patient for his cup of tea; he can take it when he can take nothing else, and he often can't take anything else if he has it not. I should be very glad if any of the abusers of tea would point out what to give to an English patient after a sleepless night, instead of tea. If you give it at five or six o'clock in the morning, he may even sometimes fall asleep after it, and get perhaps his only two or three hours' sleep during the twenty-four. At the same time you never should give tea or coffee to the sick, as a rule, after five o'clock in the afternoon. Sleeplessness in the early night is from excitement generally and is

* It is made a frequent recommendation to persons about to incur great exhaustion, either from the nature of the service, or from their being not in a state fit for it, to eat a piece of bread before they go. I wish the recommenders would themselves try the experiment of substituting a piece of bread for a cup of tea or coffee, or beef tea, as a refresher. They would find it a very poor comfort. When soldiers have to set out fasting on fatiguing duty, when nurses have to go fasting in to their patients, it is a hot restorative they want, and ought to have, before they go, not a cold bit of bread. And dreadful have been the consequences of neglecting this. If they can take a bit of bread with the hot cup of tea, so much the better, but not instead of it. The fact that there is more nourishment in bread than in almost anything else, has probably induced the mistake. That it is a fatal mistake, there is no doubt. It seems, though very little is known on the subject, that what "assimilates" itself directly, and with the least trouble of digestion with the human body, is the best for the above circumstances. Bread requires two or three processes of assimilation, before it becomes like the human body.

The almost universal testimony of English men and women who have undergone great fatigue, such as riding long journeys without stopping, or sitting up for several nights in succession, is that they could do it best upon an occasional cup of tea — and nothing else.

Let experience, not theory, decide upon this as upon all other things.
increased by tea or coffee; sleeplessness which continues to the early morning is from exhaustion often, and is relieved by tea. The only English patients I have ever known refuse tea, have been typhus cases, and the first sign of their getting better was their craving again for tea. In general, the dry and dirty tongue always prefers tea to coffee, and will quite decline milk, unless with tea. Coffee is a better restorative than tea, but a greater impairer of the digestion. Let the patient's taste decide. You will say that, in cases of great thirst, the patient's craving decides that it will drink a great deal of tea, and that you cannot help it. But in these cases be sure that the patient requires diluents for quite other purposes than quenching the thirst; he wants a great deal of some drink, not only of tea, and the doctor will order what he is to have, barley water or lemonade, or soda water and milk, as the case may be.

Lehman, quoted by Dr. Christison, says that, among the well and active "the infusion of 1 oz. of roasted coffee daily will diminish the waste" going on in the body "by one-fourth," and Dr. Christison adds that tea has the same property. Now this is actual experiment. Lehman weighs the man and finds the fact from his weight. It is not deduced from any "analysis" of food. All experience among the sick shows the same thing.*

Cocoa is often recommended to the sick in lieu of tea or coffee. But independently of the fact that English sick

* In making coffee, it is absolutely necessary to buy it in the berry and grind it at home. Otherwise you may reckon upon its containing a certain amount of chicory, at least. This is not a question of the taste or the wholesomeness of chicory. It is that chicory has nothing at all of the properties for which you give coffee. And therefore you may as well not give it.

Again, all laundresses, mistresses of dairy-farms, head nurses, (I speak of the good old sort only — women who unite a good deal of hard manual labor with the head-work necessary for arranging the day's business, so that none of it shall tread upon the heels of something else,) set great value, I have observed, upon having a high-priced tea. This is called extravagant. But these women are "extravagant" in nothing else. And they are right in this. Real tea-leaf tea alone contains the restorative they want; which is not to be found in sloe-leaf tea.

The mistresses of houses, who cannot even go over their own house once a day, are incapable of judging for these women. For they are incapable themselves, to all appearance, of the spirit of arrangement (no small task) necessary for managing a large ward or dairy.
very generally dislike cocoa, it has quite a different effect from tea or coffee. It is an oily starchy nut having no restorative power at all, but simply increasing fat. It is pure mockery of the sick, therefore, to call it a substitute for tea. For any renovating stimulus it has, you might just as well offer them chestnuts instead of tea.

An almost universal error among nurses is in the bulk of the food and especially the drinks they offer to their patients. Suppose a patient ordered 4 oz. brandy during the day, how is he to take this if you make it into four pints with diluting it? The same with tea and beef tea, with arrowroot, milk, &c. You have not increased the nourishment, you have not increased the renovating power of these articles, by increasing their bulk,—you have very likely diminished both by giving the patient’s digestion more to do, and most likely of all, the patient will leave half of what he has been ordered to take, because he cannot swallow the bulk with which you have been pleased to invest it. It requires very nice observation and care (and meets with hardly any) to determine what will not be too thick or strong for the patient to take, while giving him no more than the bulk which he is able to swallow.

VIII. BED AND BEDDING.

A few words upon bedsteads and bedding; and principally as regards patients who are entirely, or almost entirely, confined to bed.

Feverishness is generally supposed to be a symptom of fever—in nine cases out of ten it is a symptom of bedding.* The patient has had re-introduced into the body the emanations from himself which day after day and week after week saturate his unaired bedding. How can it be otherwise? Look at the ordinary bedding in which a patient lies.

If I were looking out for an example in order to show what not to do, I should take the specimen of an ordinary

* I once told a “very good nurse” that the way in which her patient’s room was kept was quite enough to account for her sleeplessness; and she answered quite good-humoredly she was not at all surprised at it—as if the state of the room were, like the state of the weather, entirely out of her power. Now in what sense was this woman to be called a “nurse?”
bed in a private house: a wooden bedstead, two or even
three mattresses piled up to above the height of a table; a
vallance attached to the frame—nothing but a miracle
could ever thoroughly dry or air such a bed and bedding.
The patient must inevitably alternate between cold damp
after his bed is made, and warm damp before, both satu-
rated with organic matter,* and this from the time the
mattresses are put under him till the time they are picked
to pieces, if this is ever done.

If you consider that an adult in health exhales by the
lungs and skin in the twenty-four hours three pints at least
of moisture, loaded with organic matter ready to enter into
putrefaction; that in sickness the quantity is often greatly
increased, the quality is always more noxious—just ask
yourself next where does all this moisture go to? Chiefly
into the bedding, because it cannot go anywhere else.
And it stays there; because, except perhaps a weekly
change of sheets, scarcely any other airing is attempted.
A nurse will be careful to fidgetiness about airing the clean
sheets from clean damp, but airing the dirty sheets from
noxious damp will never even occur to her. Besides this,
the most dangerous effluvia we know of are from the
excreta of the sick—these are placed, at least temporarily,
where they must throw their effluvia into the under side
of the bed, and the space under the bed is never aired; it
cannot be, with our arrangements. Must not such a bed
be always saturated, and be always the means of re-intro-
ducing into the system of the unfortunate patient who lies
in it, that excrementitious matter to eliminate which from
the body nature had expressly appointed the disease?

My heart always sinks within me when I hear the good
house-wife, of every class, say, "I assure you the bed has
been well slept in," and I can only hope it is not true.
What? is the bed already saturated with somebody else's
damp before my patient comes to exhale in it his own
damp? Has it not had a single chance to be aired? No,
not one. "It has been slept in every night."

* For the same reason if, after washing a patient, you must put the
same night-dress on him again, always give it a preliminary warm at
the fire. The night-gown he has worn must be, to a certain extent,
damp. It has now got cold from having been off him for a few min-
utes. The fire will dry and at the same time air it. This is much more
important than with clean things.
The only way of really nursing a real patient is to have an iron bedstead, with rheocline springs, which are permeable by the air up to the very mattress (no vallance, of course), the mattress to be a thin hair one; the bed to be not above 3½ feet wide. If the patient be entirely confined to his bed, there should be two such bedsteads; each bed to be "made" with mattress, sheets, blankets, &c., complete—the patient to pass twelve hours in each; on no account to carry his sheets with him. The whole of the bedding to be hung up to air for each intermediate twelve hours. Of course there are many cases where this cannot be done at all—many more where only an approach to it can be made. I am indicating the ideal of nursing, and what I have actually had done. But about the kind of bedstead there can be no doubt, whether there be one or two provided.

There is a prejudice in favor of a wide bed—I believe it to be a prejudice. All the refreshment of moving a patient from one side to the other of his bed is far more effectually secured by putting him into a fresh bed; and a patient who is really very ill does not stray far in bed. But it is said there is no room to put a tray down on a narrow bed. No good nurse will ever put a tray on a bed at all. If the patient can turn on his side, he will eat more comfortably from a bed-side table; and on no account whatever should a bed ever be higher than a sofa. Otherwise the patient feels himself "out of humanity's reach;" he can get at nothing for himself: he can move nothing for himself. If the patient cannot turn, a table over the bed is a better thing. I need hardly say that a patient's bed should never have its side against the wall. The nurse must be able to get easily to both sides of the bed, and to reach easily every part of the patient without stretching—a thing impossible if the bed be either too wide or too high.

When I see a patient in a room nine or ten feet high upon a bed between four and five feet high, with his head, when he is sitting up in bed, actually within two or three feet of the ceiling, I ask myself, is this expressly planned to produce that peculiarly distressing feeling common to the sick, viz., as if the walls and ceiling were closing in upon them, and they becoming sandwiches between floor and ceiling, which imagination is not, indeed, here so far from the truth? If, over and above this, the window stops
short of the ceiling, then the patient's head may literally be raised above the stratum of fresh air, even when the window is open. Can human perversity any farther go, in unmaking the process of restoration which God has made? The fact is, that the heads of sleepers or of sick should never be higher than the throat of the chimney, which ensures their being in the current of best air. And we will not suppose it possible that you have closed your chimney with a chimney-board.

If a bed is higher than a sofa, the difference of the fatigue of getting in and out of bed will just make the difference, very often, to the patient (who can get in and out of bed at all) of being able to take a few minutes' exercise, either in the open air or in another room. It is so very odd that people never think of this, or of how many more times a patient who is in bed for the twenty-four hours is obliged to get in and out of bed than they are, who only, it is to be hoped, get into bed once and out of bed once during the twenty-four hours.

A patient's bed should always be in the lightest spot in the room; and he should be able to see out of window.

I need scarcely say that the old four-post bed with curtains is utterly inadmissible, whether for sick or well. Hospital bedsteads are in many respects very much less objectionable than private ones.

There is reason to believe that not a few of the apparently unaccountable cases of scrofula among children proceed from the habit of sleeping with the head under the bed clothes, and so inhaling air already breathed, which is farther contaminated by exhalations from the skin. Patients are sometimes given to a similar habit, and it often happens that the bed clothes are so disposed that the patient must necessarily breathe air more or less contaminated by exhalations from his skin. A good nurse will be careful to attend to this. It is an important part, so to speak, of ventilation.

It may be worth while to remark, that where there is any danger of bed-sores a blanket should never be placed under the patient. It retains damp and acts like a poultice.

Never use anything but light Whitney blankets as bed covering for the sick. The heavy cotton impervious counterpane is bad, for the very reason that it keeps in the
emanations from the sick person, while the blanket allows them to pass through. Weak patients are invariably distressed by a great weight of bed clothes, which often prevents their getting any sound sleep whatever.

Note.—One word about pillows. Every weak patient, be his illness what it may, suffers more or less from difficulty in breathing. To take the weight of the body off the poor chest, which is hardly up to its work as it is, ought therefore to be the object of the nurse in arranging his pillows. Now what does she do and what are the consequences? She piles the pillows one a-top of the other like a wall of bricks. The head is thrown upon the chest. And the shoulders are pushed forward, so as not to allow the lungs room to expand. The pillows, in fact, lean upon the patient, not the patient upon the pillows. It is impossible to give a rule for this, because it must vary with the figure of the patient. And tall patients suffer much more than short ones, because of the drag of the long limbs upon the waist. But the object is to support, with the pillows, the back below the breathing apparatus, to allow the shoulders room to fall back, and to support the head, without throwing it forward. The suffering of dying patients is immensely increased by neglect of these points. And many an invalid, too weak to drag about his pillows himself, slips his book or anything at hand behind the lower part of his back to support it.

IX. LIGHT.

It is the unqualified result of all my experience with the sick, that second only to their need of fresh air is their need of light; that, after a close room, what hurts them most is a dark room. And that it is not only light but sunlight they want. I had rather have the power of carrying my patient about after the sun, according to the aspect of the rooms, if circumstances permit, than let him linger in a room when the sun is off. People think the effect is upon the spirits only. This is by no means the case. The sun is not only a painter but a sculptor. You admit that he does the photograph. Without going into any scientific exposition we must admit that light has quite as real and tangible effects upon the human body. But this is not all. Who has not observed the purifying effect of light, and especially of direct sunlight, upon the air of a room? Here is an observation within everybody's experience. Go into a room where the shutters are always shut (in a sick room or a bed-room there never should be shutters shut,) and though the room be uninhabited, though
the air has never been polluted by the breathing of human beings, you will observe a close, musty smell of corrupt air, *i. e.* of air unpurified by the effect of the sun's rays. The mustiness of dark rooms and corners, indeed, is proverbial. The cheerfulness of a room, the usefulness of light in treating disease is all-important.

A very high authority in hospital construction has said that people do not enough consider the difference between wards and dormitories in planning their buildings. But I go farther, and say, that healthy people never remember the difference between bed-rooms and sick-rooms, in making arrangements for the sick. To a sleeper in health it does not signify what the view is from his bed. He ought never to be in it excepting when asleep, and at night. Aspect does not very much signify either (provided the sun reach his bed-room some time in every day, to purify the air), because he ought never to be in his bed-room except during the hours when there is no sun. But the case is exactly reversed with the sick, even should they be as many hours out of their beds as you are in yours, which probably they are not. Therefore, that they should be able, without raising themselves or turning in bed, to see out of window from their beds, to see sky and sunlight at least, if you can show them nothing else, I assert to be, if not of the very first importance for recovery, at least something very near it. And you should therefore look to the position of the beds of your sick one of the very first things. If they can see out of two windows instead of one, so much the better. Again, the morning sun and the mid-day sun — the hours when they are quite certain not to be up, are of more importance to them, if a choice must be made, than the afternoon sun. Perhaps you can take them out of bed in the afternoon and set them by the window, where they can see the sun. But the best rule is, if possible, to give them direct sunlight from the moment he rises till the moment he sets.

Another great difference between the bed-room and the sick-room is, that the sleeper has a very large balance of fresh air to begin with, when he begins the night, if his room has been open all day as it ought to be; the sick man has not, because all day he has been breathing the air in the same room, and dirtying it by the emanations from
himself. Far more care is therefore necessary to keep up a constant change of air in the sick-room.

It is hardly necessary to add that there are acute cases (particularly a few ophthalmic cases, and diseases where the eye is morbidly sensitive), where a subdued light is necessary. But a dark north room is inadmissible even for these. You can always moderate the light by blinds and curtains.

Heavy, thick, dark window or bed curtains should, however, hardly ever be used for any kind of sick in this country. A light white curtain at the head of the bed is, in general, all that is necessary, and a green blind to the window, to be drawn down only when necessary.

One of the greatest observers of human things (not physiological), says, in another language, "Where there is sun there is thought." All physiology goes to confirm this. Where is the shady side of deep vallies, there is cretinism. Where are cellars and the unsunned sides of narrow streets, there is the degeneracy and weakness of the human race—mind and body equally degenerating. Put the pale withering plant and human being into the sun, and, if not too far gone, each will recover health and spirit.

It is a curious thing to observe how almost all patients lie with their faces turned to the light, exactly as plants always make their way towards the light; a patient will even complain that it gives him pain "lying on that side." "Then why do you lie on that side?" He does not know,—but we do. It is because it is the side towards the window. A fashionable physician has recently published in a government report that he always turns his patients' faces from the light. Yes, but nature is stronger than fashionable physicians, and depend upon it she turns the faces back and towards such light as she can get. Walk through the wards of a hospital, remember the bed sides of private patients you have seen, and count how many sick you ever saw lying with their faces towards the wall.

X. CLEANLINESS OF ROOMS AND WALLS.

It cannot be necessary to tell a nurse that she should be clean, or that she should keep her patient clean,—seeing that the greater part of nursing consists in preserving
CLEANLINESS OF ROOMS AND WALLS.

67

cleanliness. No ventilation can freshen a room or ward where the most scrupulous cleanliness is not observed. Unless the wind be blowing through the windows at the rate of twenty miles an hour, dusty carpets, dirty wainscots, musty curtains and furniture, will infallibly produce a close smell. I have lived in a large and expensively furnished London house, where the only constant inmate in two very lofty rooms, with opposite windows, was myself, and yet, owing to the above-mentioned dirty circumstances, no opening of windows could ever keep those rooms free from closeness; but the carpet and curtains having been turned out of the rooms altogether, they became instantly as fresh as could be wished. It is pure nonsense to say that in London a room cannot be kept clean. Many of our hospitals show the exact reverse.

But no particle of dust is ever or can ever be removed or really got rid of by the present system of dusting. Dusting in these days means nothing but flapping the dust from one part of a room to another with doors and windows closed. What you do it for I cannot think. You had much better leave the dust alone, if you are not going to take it away altogether. For from the time a room begins to be a room up to the time when it ceases to be one, no one atom of dust ever actually leaves its precincts. Tidying a room means nothing now but removing a thing from one place, which it has kept clean for itself; on to another and a dirtier one.* Flapping by way of cleaning is only admissible in the case of pictures, or anything made of paper. The only way I know to remove dust, the plague of all lovers of fresh air, is to wipe everything with a damp cloth. And all furniture ought to be so made as that it

* If you like to clean your furniture by laying out your clean clothes upon your dirty chairs or sofa, this is one way certainly of doing it. Having witnessed the morning process called "tidying the room" for many years, and with ever-increasing astonishment, I can describe what it is. From the chairs, tables, or sofa, upon which the "things" have lain during the night, and which are therefore comparatively clean from dust or blacks, the poor "things" having "caught" it, they are removed to other chairs, tables, sofas, upon which you could write your name with your finger in the dust or blacks. The other side of the "things" is therefore now evenly dirtied or dusted. The housemaid then flaps everything, or some things, not out of her reach, with a thing called a duster — the dust flies up, then re-settles more equally than it lay before the operation. The room has now been "put to rights."
may be wiped with a damp cloth without injury to itself, and so polished as that it may be damped without injury to others. To dust, as it is now practised, truly means to distribute dust more equally over a room.

As to floors, the only really clean floor I know is the Berlin lacquered floor, which is wet rubbed and dry rubbed every morning to remove the dust. The French parquet is always more or less dusty, although infinitely superior in point of cleanliness and healthiness to our absorbent floor.

For a sick room, a carpet is perhaps the worst expedient which could by any possibility have been invented. If you must have a carpet, the only safety is to take it up two or three times a year, instead of once. A dirty carpet literally infects the room. And if you consider the enormous quantity of organic matter from the feet of people coming in, which must saturate it, this is by no means surprising.

As for walls, the worst is the papered wall; the next worst is plaster. But the plaster can be redeemed by frequent lime-washing; the paper requires frequent renewing. A glazed paper gets rid of a good deal of the danger. But the ordinary bed-room paper is all that it ought not to be.*

The close connection between ventilation and cleanliness is shown in this. An ordinary light paper will last clean much longer if there is an Arnott's ventilator in the chimney than if it otherwise would.

The best wall now extant is oil paint. From this you can wash the animal exuviae.†

These are what make a room musty.

The best wall for a sick-room or ward that could be made is pure white non-absorbent cement or glass, or glazed tiles, if they were made sightly enough.

Air can be soiled just like water. If you blow into water you will soil it with the animal matter from your breath.

* I am sure that a person who has accustomed her senses to compare atmospheres proper and improper, for the sick and for children, could tell, blindfold, the difference of the air in old painted and in old papered rooms, ceteris paribus. The latter will always be musty, even with all the windows open.

† If you like to wipe your dirty door, or some portion of your dirty wall, by hanging up your clean gown or shawl against it on a peg, this is one way certainly, and the most usual way, and generally the only way of cleaning either door or wall in a bed-room!
So it is with air. Air is always soiled in a room where walls and carpets are saturated with animal exhalations.

Want of cleanliness, then, in rooms and wards, which you have to guard against, may arise in three ways.

1. Dirty air coming in from without, soiled by sewer emanations, the evaporation from dirty streets, smoke, bits of unburnt fuel, bits of straw, bits of horse dung.

If people would but cover the outside walls of their houses with plain or encaustic tiles, what an incalculable improvement would there be in light, cleanliness, dryness, warmth, and consequently economy. The play of a fire-engine would then effectually wash the outside of a house. This kind of walling would stand next to paving in improving the health of towns.

2. Dirty air coming from within, from dust, which you often displace, but never remove. And this recalls what ought to be a sine qua non. Have as few ledges in your room or ward as possible. And under no pretence have any ledge whatever out of sight. Dust accumulates there, and will never be wiped off. This is a certain way to soil the air. Besides this, the animal exhalations from your inmates saturate your furniture. And if you never clean your furniture properly, how can your rooms or wards be anything but musty? Ventilate as you please, the rooms will never be sweet. Besides this, there is a constant degradation, as it is called, taking place from everything except polished or glazed articles — e.g., in coloring certain green papers arsenic is used. Now in the very dust even, which is lying about in rooms hung with this kind of green paper, arsenic has been distinctly detected. You see your dust is anything but harmless; yet you will let such dust lie about your ledges for months, your rooms forever.

Again, the fire fills the room with coal dust.

3. Dirty air coming from the carpet. Above all, take care of the carpets, that the animal dirt left there by the feet of visitors does not stay there. Floors, unless the grain is filled up and polished, are just as bad. The smell from the floor of a school-room or ward, when any moisture brings out the organic matter by which it is saturated, might alone be enough to warn us of the mischief that is going on.

The outer air, then, can only be kept clean by sanitary improvements, and by consuming smoke. The expense in
soap, which this single improvement would save, is quite incalculable.

The inside air can only be kept clean by excessive care in the ways mentioned above—to rid the walls, carpets, furniture, ledges, &c., of the organic matter and dust—dust consisting greatly of this organic matter—with which they become saturated, and which is what really makes the room musty.

Without cleanliness, you cannot have all the effect of ventilation; without ventilation, you can have no thorough cleanliness.

Very few people, be they of what class they may, have any idea of the exquisite cleanliness required in the sick-room. For much of what I have said applies less to the hospital than to the private sick-room. The smoky chimney, the dusty furniture, the utensils emptied but once a day, often keep the air of the sick constantly dirty in the best private houses.

The well have a curious habit of forgetting that what is to them but a trifling inconvenience, to be patiently "put up" with, is to the sick a source of suffering, delaying recovery, if not actually hastening death. The well are scarcely ever more than eight hours, at most, in the same room. Some change they can always make, if only for a few minutes. Even during the supposed eight hours, they can change their posture or their position in the room. But the sick man, who never leaves his bed, who cannot change by any movement of his own his air, or his light, or his warmth; who cannot obtain quiet, or get out of the smoke, or the smell, or the dust; he is really poisoned or depressed by what is to you the merest trifle.

"What can't be cured must be endured," is the very worst and most dangerous maxim for a nurse which ever was made. Patience and resignation in her are but other words for carelessness or indifference—contemptible, if in regard to herself; culpable, if in regard to her sick.

XI. PERSONAL CLEANLINESS.

In almost all diseases, the function of the skin is, more or less, disordered; and in many most important diseases nature relieves herself almost entirely by the skin. This
is particularly the case with children. But the excretion, which comes from the skin, is left there, unless removed by washing or by the clothes. Every nurse should keep this fact constantly in mind,—for, if she allow her sick to remain unwashed, or their clothing to remain on them after being saturated with perspiration or other excretion, she is interfering injuriously with the natural processes of health just as effectually as if she were to give the patient a dose of slow poison by the mouth. Poisoning by the skin is no less certain than poisoning by the mouth,—only it is slower in its operation.

The amount of relief and comfort experienced by sick after the skin has been carefully washed and dried, is one of the commonest observations made at a sick bed. But it must not be forgotten that the comfort and relief so obtained are not all. They are, in fact, nothing more than a sign that the vital powers have been relieved by removing something that was oppressing them. The nurse, therefore, must never put off attending to the personal cleanliness of her patient under the plea that all that is to be gained is a little relief, which can be quite as well given later.

In all well-regulated hospitals this ought to be, and generally is, attended to. But it is very generally neglected with private sick.

Just as it is necessary to renew the air round a sick person frequently, to carry off morbid effluvia from the lungs and skin, by maintaining free ventilation, so it is necessary to keep the pores of the skin free from all obstructing excretions. The object, both of ventilation and of skin-cleanness, is pretty much the same,—to wit, removing noxious matter from the system as rapidly as possible.

Care should be taken in all these operations of sponging, washing, and cleansing the skin, not to expose too great a surface at once, so as to check the perspiration, which would renew the evil in another form.

The various ways of washing the sick need not here be specified,—the less so as the doctors ought to say which is to be used.

In several forms of diarrhea, dysentery, &c., where the skin is hard and harsh, the relief afforded by washing with a great deal of soft soap is incalculable. In other cases, sponging with tepid soap and water, then with tepid water and drying with a hot towel will be ordered.
Every nurse ought to be careful to wash her hands very frequently during the day. If her face too, so much the better.

One word as to cleanliness merely as cleanliness.

Compare the dirtiness of the water in which you have washed when it is cold without soap, cold with soap, hot with soap. You will find the first has hardly removed any dirt at all, the second a little more, the third a great deal more. But hold your hand over a cup of hot water for a minute or two, and then, by merely rubbing with the finger, you will bring off flakes of dirt or dirty skin. After a vapor bath you may peel your whole self clean in this way. What I mean is, that by simply washing or sponging with water you do not really clean your skin. Take a rough towel, dip one corner in very hot water,—if a little spirit be added to it it will be more effectual,—and then rub as if you were rubbing the towel into your skin with your fingers. The black flakes which will come off will convince you that you were not clean before, however much soap and water you have used. These flakes are what require removing. And you can really keep yourself cleaner with a tumbler of hot water and a rough towel and rubbing, than with a whole apparatus of bath and soap and sponge, without rubbing. It is quite nonsense to say that anybody need be dirty. Patients have been kept as clean by these means on a long voyage, when a basin full of water could not be afforded, and when they could not be moved out of their berths, as if all the appurtenances of home had been at hand.

Washing, however, with a large quantity of water has quite other effects than those of mere cleanliness. The skin absorbs the water and becomes softer and more perspirable. To wash with soap and soft water is, therefore, desirable from other points of view than that of cleanliness.

XII. CHATTERING HOPES AND ADVICES.

The sick man to his advisers.

"My advisers! Their name is legion. * * * Somehow or other, it seems a provision of the universal destinies, that every man, woman, and child should consider him, her, or itself privileged especially to advise me.
Why? That is precisely what I want to know." And this is what I have to say to them. I have been advised to go to every place extant in and out of England—to take every kind of exercise by every kind of cart, carriage—yes, and even swing (!) and dumb-bell (!) in existence; to imbibe every different kind of stimulus that ever has been invented. And this when those best fitted to know, viz., medical men, after long and close attendance, had declared any journey out of the question, had proh-ibited any kind of motion whatever, had closely laid down the diet and drink. What would my advisers say, were they the medical attendants, and I the patient left their advice, and took the casual adviser's? But the singularity in Legion's mind is this: it never occurs to him that everybody else is doing the same thing, and that I the pa-tient must perforce say, in sheer self-defence, like Rosalind, "I could not do with all."

"Chattering Hopes" may seem an odd heading. But I really believe there is scarcely a greater worry which in-valids have to endure than the incurable hopes of their friends. There is no one practice against which I can speak more strongly from actual personal experience, wide and long, of its effects during sickness observed both upon others and upon myself. I would appeal most seriously to all friends, visitors, and attendants of the sick to leave off this practice of attempting to "cheer" the sick by making light of their danger and by exaggerating their probabili-ties of recovery.

Far more now than formerly does the medical attendant tell the truth to the sick who are really desirous to hear it about their own state.

How intense is the folly, then, to say the least of it, of the friend, be he even a medical man, who thinks that his opinion, given after a cursory observation, will weigh with the patient, against the opinion of the medical attendant, given, perhaps, after years of observation, after using every help to diagnosis afforded by the stethoscope, the exami-nation of pulse, tongue, &c.; and certainly after much more observation than the friend can possibly have had.

Supposing the patient to be possessed of common sense —how can the "favourable" opinion, if it is to be called an opinion at all, of the casual visitor "cheer" him,— when different from that of the experienced attendant?
Unquestionably the latter may, and often does, turn out to be wrong. But which is most likely to be wrong?

The fact is, that the patient * is not “cheered” at all by these well-meaning, most tiresome friends. On the contrary, he is depressed and wearied. If, on the one hand, he exerts himself to tell each successive member of this too numerous conspiracy, whose name is legion, why he does not think as they do,—in what respect he is worse,—what symptoms exist that they know nothing of,—he is fatigued instead of “cheered,” and his attention is fixed upon himself. In general, patients who are really ill, do not want to talk about themselves. Hypochondriacal do, but again I say we are not on the subject of hypochondriacal.

If, on the other hand, and which is much more frequently the case, the patient says nothing, but the Shake-spearian “Oh!” “Ah!” “Go to!” and “In good sooth!” in order to escape from the conversation about himself the sooner, he is depressed by want of sympathy. He feels isolated in the midst of friends. He feels what a convenience it would be, if there were any single person to whom

* There are, of course, cases, as in first confinements, when an assurance from the doctor or experienced nurse to the frightened suffering woman that there is nothing unusual in her case, that she has nothing to fear but a few hours’ pain, may cheer her most effectually. This is advice of quite another order. It is the advice of experience to utter inexperience. But the advice we have been referring to is the advice of inexperience to bitter experience; and, in general, amounts to nothing more than this, that you think I shall recover from consumption because somebody knows somebody somewhere who has recovered from fever.

I have heard a doctor condemned whose patient did not, alas! recover, because another doctor’s patient of a different sex, of a different age, recovered from a different disease, in a different place. Yes, this is really true. If people who make these comparisons did but know (only they do not care to know), the care and preciseness with which such comparisons require to be made, (and are made,) in order to be of any value whatever, they would spare their tongues. In comparing the deaths of one hospital with those of another, any statistics are justly considered absolutely valueless which do not give the ages, the sexes, and the diseases of all the cases. It does not seem necessary to mention this. It does not seem necessary to say that there can be no comparison between old men with dropsies and young women with consumptions. Yet the cleverest men and the cleverest women are often heard making such comparisons, ignoring entirely sex, age, disease, place—in fact, all the conditions essential to the question. It is the merest gossip.
he could speak simply and openly, without pulling the string upon himself of this shower-bath of silly hopes and encouragements; to whom he could express his wishes and directions without that person persisting in saying "I hope that it will please God yet to give you twenty years," or, "You have a long life of activity before you." How often we see at the end of biographies or of cases recorded in medical papers, "after a long illness A. died rather suddenly," or, "unexpectedly both to himself and to others." "Unexpectedly" to others, perhaps, who did not see, because they did not look; but by no means "unexpectedly to himself," as I feel entitled to believe, both from the internal evidence in such stories, and from watching similar cases: there was every reason to expect that A. would die, and he knew it; but he found it useless to insist upon his own knowledge to his friends.

In these remarks I am alluding neither to acute cases which terminate rapidly nor to "nervous" cases.

By the first much interest in their own danger is very rarely felt. In writings of fiction, whether novels or biographies, these death-beds are generally depicted as almost seraphic in lucidity of intelligence. Sadly large has been my experience in death-beds, and I can only say that I have seldom or never seen such. Indifference, excepting with regard to bodily suffering, or to some duty the dying man desires to perform, is the far more usual state.

The "nervous case," on the other hand, delights in figuring to himself and others a fictitious danger.

But the long chronic case, who knows too well himself, and who has been told by his physician that he will never enter active life again, who feels that every month he has to give up something he could do the month before — oh! spare such sufferers your chattering hopes. You do not know how you worry and weary them. Such real sufferers cannot bear to talk of themselves, still less to hope for what they cannot at all expect.

So also as to all the advice showered so profusely upon such sick, to leave off some occupation, to try some other doctor, some other house, climate, pill, powder, or specific; I say nothing of the inconsistency — for these advisers are sure to be the same persons who exhorted the sick man not to believe his own doctor's prognostics, because "doctors are always mistaken," but to believe some other
doctor, because "this doctor is always right." Sure also are these advisers to be the persons to bring the sick man fresh occupation, while exhorting him to leave his own.

Wonderful is the face with which friends, lay and medical, will come in and worry the patient with recommendations to do something or other, having just as little knowledge as to its being feasible, or even safe for him, as if they were to recommend a man to take exercise, not knowing he had broken his leg. What would the friend say, if he were the medical attendant, and if the patient, because some other friend had come in, because somebody, anybody, nobody, had recommended something, anything, nothing, were to disregard his orders, and take that other body's recommendation? But people never think of this.

A celebrated historical personage has related the commonplaces which, when on the eve of executing a remarkable resolution, were showered in nearly the same words by every one around successively for a period of six months. To these the personage states that it was found least trouble always to reply the same thing, viz., that it could not be supposed that such a resolution had been taken without sufficient previous consideration. To patients enduring every day for years from every friend or acquaintance, either by letter or viva voce, some torment of this kind, I would suggest the same answer. It would indeed be spared, if such friends and acquaintances would but consider for one moment, that it is probable the patient has heard such advice at least fifty times before, and that, had it been practicable, it would have been practised long ago. But of such consideration there appears to be no chance. Strange, though true, that people should be just the same in these things as they were a few hundred years ago!

To me these commonplaces, leaving their smear upon the cheerful, single-hearted, constant devotion to duty, which is so often seen in the decline of such sufferers, recall the slimy trail left by the snail on the sunny southern garden-wall loaded with fruit.

No mockery in the world is so hollow as the advice showered upon the sick. It is of no use for the sick to say anything, for what the adviser wants is, not to know the truth about the state of the patient, but to turn whatever the sick may say to the support of his own argument,
set forth, it must be repeated, without any inquiry whatever into the patient's real condition. "But it would be impertinent or indecent in me to make such an inquiry," says the adviser. True; and how much more impertinent is it to give your advice when you can know nothing about the truth, and admit you could not inquire into it.

To nurses I say—all are the visitor who do your patient harm. When you hear him told:—1. That he has nothing the matter with him, and that he wants cheering. 2. That he is committing suicide, and that he wants preventing. 3. That he is the tool of somebody who makes use of him for a purpose. 4. That he will listen to nobody, but is obstinately bent upon his own way; and 5. That he ought to be called to a sense of duty, and is flying in the face of Providence;—then know that your patient is receiving all the injury that he can receive from a visitor.

How little the real sufferings of illness are known or understood. How little does any one in good health fancy him or even herself into the life of a sick person.

Do, you who are about the sick or who visit the sick, try and give them pleasure, remember to tell them what will do so. How often in such visits the sick person has to do the whole conversation, exerting his own imagination and memory, while you would take the visitor, absorbed in his own anxieties, making no effort of memory or imagination, for the sick person. "Oh! my dear, I have so much to think of, I really quite forgot to tell him that; besides, I thought he would know it," says the visitor to another friend. How could "he know it?" Depend upon it, the people who say this are really those who have little "to think of." There are many burthened with business who always manage to keep a pigeon-hole in their minds, full of things to tell the "invalid."

I do not say, don't tell him your anxieties—is I believe it is good for him and good for you too; but if you tell him what is anxious, surely you can remember to tell him what is pleasant too.

A sick person does so enjoy hearing good news:—for instance, of a love and courtship, while in progress to a good ending. If you tell him only when the marriage takes place, he loses half the pleasure, which God knows
he has little enough of; and ten to one but you have told him of some love-making with a bad ending.

A sick person also intensely enjoys hearing of any material good, any positive or practical success of the right. He has so much of books and fiction, of principles, and precepts, and theories; do, instead of advising him with advice he has heard at least fifty times before, tell him of one benevolent act which has really succeeded practically,—it is like a day's health to him.*

You have no idea what the craving of sick with diminished power of thinking, but little power of doing, is to hear of good practical action, when they can no longer partake in it.

Do observe these things with the sick. Do remember how their life is to them disappointed and incomplete. You see them lying there with miserable disappointments, from which they can have no escape but death, and you can't remember to tell them of what would give them so much pleasure, or at least an hour's variety.

They don't want you to be lachrymose and whining with them; they like you to be fresh and active and interested, but they cannot bear absence of mind, and they are so tired of the advice and preaching they receive from everybody, no matter whom it is, they see.

There is no better society than babies and sick people for one another. Of course you must manage this so that neither shall suffer from it, which is perfectly possible. If you think the "air of the sick room" bad for the baby, why it is bad for the invalid too, and therefore you will of course correct it for both. It freshens up a sick person's whole mental atmosphere to see "the baby." And a very young child, if unspoiled, will generally adapt itself wonderfully to the ways of a sick person, if the time they spend together is not too long.

If you knew how unreasonably sick people suffer from reasonable causes of distress, you would take more pains about all these things. An infant laid upon the sick bed will do the sick person, thus suffering, more good than all

* A small pet animal is often an excellent companion for the sick, for long chronic cases especially. A pet bird in a cage is sometimes the only pleasure of an invalid confined for years to the same room. If he can feed and clean the animal himself, he ought always to be encouraged to do so.
your logic. A piece of good news will do the same. Perhaps you are afraid of "disturbing" him. You say there is no comfort for his present cause of affliction. It is perfectly reasonable. The distinction is this: if he is obliged to act, do not "disturb" him with another subject of thought just yet; help him to do what he wants to do; but, if he has done this, or if nothing can be done, then "disturb" him by all means. You will relieve, more effectually, unreasonable suffering from reasonable causes by telling him "the news," showing him "the baby," or giving him something new to think of or to look at than by all the logic in the world.

It has been very justly said that the sick are like children in this, that there is no proportion in events to them. Now it is your business as their visitor to restore this right proportion for them — to show them what the rest of the world is doing. How can they find it out otherwise? You will find them far more open to conviction than children in this. And you will find that their unreasonable intensity of suffering from unkindness, from want of sympathy, &c., will disappear with their freshened interest in the big world's events. But then you must be able to give them real interests, not gossip.

Note. — There are two classes of patients which are unfortunately becoming more common every day, especially among women of the richer orders, to whom all these remarks are preeminently inapplicable. 1. Those who make health an excuse for doing nothing, and at the same time allege that the being able to do nothing is their only grief. 2. Those who have brought upon themselves ill-health by over pursuit of amusement, which they and their friends have most unhappily called intellectual activity. I scarcely know a greater injury that can be inflicted than the advice too often given to the first class to "vegetate" — or than the admiration too often bestowed on the latter class for "pluck."

XIII. OBSERVATION OF THE SICK.

There is no more silly or universal question scarcely asked than this, "Is he better?" Ask it of the medical attendant, if you please. But of whom else, if you wish for a real answer to your question, would you ask it? Certainly not of the casual visitor; certainly not of the nurse, while the nurse's observation is so little exercised as it is
now. What you want are facts, not opinions; for who can have any opinion of any value as to whether the patient is better or worse, excepting the constant medical attendant, or the really observing nurse?

The most important practical lesson that can be given to nurses is to teach them what to observe—how to observe—what symptoms indicate improvement—what the reverse—which are of importance—which are of none—which are the evidence of neglect—and of what kind of neglect.

All this is what ought to make part, and an essential part, of the training of every nurse. At present, how few there are, either professional or unprofessional, who really know at all whether any sick person they may be with is better or worse.

The vagueness and looseness of the information one receives in answer to that much abused question, “Is he better?” would be ludicrous, if it were not painful. The only sensible answer (in the present state of knowledge about sickness) would be “How can I know? I cannot tell how he was when I was not with him.”

I can record but a very few specimens of the answers*

* It is a much more difficult thing to speak the truth than people commonly imagine. There is the want of observation simple, and the want of observation compound, compounded, that is, with the imaginative faculty. Both may equally intend to speak the truth. The information of the first is simply defective. That of the second is much more dangerous. The first gives, in answer to a question asked about a thing that has been before his eyes perhaps for years, information exceedingly imperfect, or says, he does not know. He has never observed. And people simply think him stupid.

The second has observed just as little, but imagination immediately steps in, and he describes the whole thing from imagination merely, being perfectly convinced all the while that he has seen or heard it; or he will repeat a whole conversation, as if it were information which had been addressed to him; whereas it is merely what he has himself said to somebody else. This is the commonest of all. These people do not even observe that they have not observed, nor remember that they have forgotten.

Courts of justice seem to think that anybody can speak “the whole truth, and nothing but the truth,” if he does but intend it. It requires many faculties combined of observation and memory to speak “the whole truth,” and to say “nothing but the truth.”

“I knows I fibs dreadful; but believe me, Miss, I never finds out I have fibbed until they tells me so,” was a remark actually made. It is also one of much more extended application than most people have the least idea of.
which I have heard made by friends and nurses, and accepted by physicians and surgeons at the very bed-side of the patient, who could have contradicted every word, but did not—sometimes from amiability, often from shyness, oftenest from languor!

“How often have the bowels acted, nurse?” “Once, sir.” This generally means that the utensil has been emptied once, it having been used perhaps seven or eight times.

“Do you think the patient is much weaker than he was six weeks ago?” “Oh no, sir; you know it is very long since he has been up and dressed, and he can get across the room now.” This means that the nurse has not observed that whereas six weeks ago he sat up and occupied himself in bed, he now lies still doing nothing; that although he can “get across the room,” he cannot stand for five seconds.

Another patient who is eating well, recovering steadily, although slowly, from fever, but cannot walk or stand, is represented to the doctor as making no progress at all.

Questions, too, as asked now (but too generally) of or about patients, would obtain no information at all about them, even if the person asked of had every information to give. The question is generally a leading question; and it is singular that people never think what must be the answer to this question before they ask it: for instance, “Has he had a good night?” Now, one patient will think he has had a bad night if he has not slept ten hours without waking. Another does not think he has had a bad night if he has had intervals of dozing occasionally. The same answer has actually been given as regarded two pa-

Concurrence of testimony, which is so often adduced as final proof, may prove nothing more, as is well known to those accustomed to deal with the unobservant imaginative, than that one person has told his story a great many times.

I have heard thirteen persons “concur” in declaring that a fourteenth, who had never left his bed, went to a distant chapel every morning at seven o’clock.

I have heard persons in perfect good faith declare, that a man came to dine every day at the house where they lived, who had never dined there once; that a person had never taken the sacrament, by whose side they had twice at least knelt at Communion; that but one meal a day came out of a hospital kitchen, which for six weeks they had seen provide from three to five and six meals a day. Such instances might be multiplied ad infinitum if necessary.
tients—one who had been entirely sleepless for five times twenty-four hours, and died of it, and another who had not slept the sleep of a regular night, without waking. Why cannot the question be asked, How many hours' sleep has ——— had? and at what hours of the night? * "I have never closed my eyes all night," an answer as frequently made when the speaker has had several hours' sleep as when he has had none, would then be less often said. Lies, intentional and unintentional, are much seldom told in answer to precise than to leading questions.

Another frequent error is to inquire whether one cause remains, and not whether the effect which may be produced by a great many different causes, not inquired after, remains. As when it is asked, whether there was noise in the street last night; and if there were not, the patient is reported, without more ado, to have had a good night. Patients are completely taken aback by these kinds of leading questions, and give only the exact amount of information asked for, even when they know it to be completely misleading. The shyness of patients is seldom allowed for.

How few there are who, by five or six pointed questions, can elicit the whole case, and get accurately to know and to be able to report where the patient is.

I knew a very clever physician, of large dispensary and hospital practice, who invariably began his examination of each patient with "Put your finger where you be bad." That man would never waste his time with collecting inaccurate information from nurse or patient. Leading questions always collect inaccurate information.

At a recent celebrated trial, the following leading question was put successively to nine distinguished medical men. "Can you attribute these symptoms to anything else but poison?" And out of the nine, eight answered "No!" without any qualification whatever. It appeared,

* This is important, because on this depends what the remedy will be. If a patient sleeps two or three hours early in the night, and then does not sleep again at all, ten to one it is not a narcotic he wants, but food or stimulus, or perhaps only warmth. If, on the other hand, he is restless and awake all night, and is drowsy in the morning, he probably wants sedatives, either quiet, coolness, or medicine, a lighter diet, or all four. Now the doctor should be told this, or how can he judge what to give?
upon cross-examination: — 1. That none of them had ever seen a case of the kind of poisoning supposed. 2. That none of them had ever seen a case of the kind of disease to which the death, if not to poison, was attributable. 3. That none of them were even aware of the main fact of the disease and condition to which the death was attributable.

Surely nothing stronger can be adduced to prove what use leading questions are of, and what they lead to.

I had rather not say how many instances I have known, where, owing to this system of leading questions, the patient has died, and the attendants have been actually unaware of the principal feature of the case.

It is useless to go through all the particulars, besides sleep, in which people have a peculiar talent for gleaning inaccurate information. As to food, for instance, I often think that most common question, How is your appetite? can only be put because the questioner believes the questioned has really nothing the matter with him, which is very often the case. But where there is, the remark holds good which has been made about sleep. The same answer will often be made as regards a patient who cannot take two ounces of solid food per diem, and a patient who does not enjoy five meals a day as much as usual.

Again, the question, How is your appetite? is often put when How is your digestion? is the question meant. No doubt the two things depend on one another. But they are quite different. Many a patient can eat, if you can only "tempt his appetite." The fault lies in your not having got him the thing he fancies. But many another patient does not care between grapes and turnips — every thing is equally distasteful to him. He would try to eat anything which would do him good; but everything "makes him worse." The fault here generally lies in the cooking. It is not his "appetite" which requires "tempting," it is his digestion which requires sparing. And good sick cookery will save the digestion half its work.

There may be four different causes, any one of which will produce the same result, viz., the patient slowly starving to death from want of nutrition:
1. Defect in cooking;
2. Defect in choice of diet;
3. Defect in choice of hours for taking diet;
4. Defect of appetite in patient.
Yet all these are generally comprehended in the one sweeping assertion that the patient has "no appetite."

Surely many lives might be saved by drawing closer distinction; for the remedies are as diverse as the causes. The remedy for the first is to cook better; for the second, to choose other articles of diet; for the third, to watch for the hours when the patient is in want of food; for the fourth, to show him what he likes and sometimes unexpectedly. But no one of these remedies will do for any other of the defects not corresponding with it.

I cannot too often repeat that patients are generally either too languid to observe these things, or too shy to speak about them; nor is it well that they should be made to observe them, it fixes their attention upon themselves.

Again, I say, what is the nurse or friend there for except to take note of these things, instead of the patient doing so?*

Again, the question is sometimes put, Is there diarrhoea? And the answer will be the same, whether it is just merging into cholera, whether it is a trifling degree brought on by some trifling indiscretion, which will cease the moment the cause is removed, or whether there is no diarrhoea at all but simply relaxed bowels.

It is useless to multiply instances of this kind. As long as observation is so little cultivated as it is now, I do believe that it is better for the physician not to see the friends of the patient at all. They will oftener mislead him than not. And as often by making the patient out worse as better than he really is.

In the case of infants, everything must depend upon the accurate observation of the nurse or mother who has to report. And how seldom is this condition of accuracy fulfilled.

A celebrated man, though celebrated only for foolish

* It is commonly supposed that the nurse is there to spare the patient from making physical exertion for himself—I would rather say that she ought to be there to spare him from taking thought for himself. And I am quite sure, that if the patient were spared all thought for himself, and not spared all physical exertion, he would be infinitely the gainer. The reverse is generally the case in the private house. In the hospital it is the relief from all anxiety, afforded by the rules of a well-regulated institution, which has often such a beneficial effect upon the patient.
things, has told us that one of his main objects in the education of his son, was to give him a ready habit of accurate observation, a certainty of perception, and that for this purpose one of his means was a month's course as follows:—he took the boy rapidly past a toy-shop; the father and son then described to each other as many of the objects as they could, which they had seen in passing the windows, noting them down with pencil and paper, and returning afterwards to verify their own accuracy. The boy always succeeded best, e.g., if the father described 30 objects, the boy did 40, and scarcely ever made a mistake.

I have often thought how wise a piece of education this would be for much higher objects; and in our calling of nurses the thing itself is essential. For it may safely be said, not that the habit of ready and correct observation will by itself make us useful nurses, but that without it we shall be useless with all our devotion.

I have known a nurse in charge of a set of wards, who not only carried in her head all the little varieties in the diets which each patient was allowed to fix for himself, but also exactly what each patient had taken during each day. I have known another nurse in charge of one single patient, who took away his meals day after day all but untouched, and never knew it.

If you find it helps you to note down such things on a bit of paper, in pencil, by all means do so. I think it more often lames than strengthens the memory and observation. But if you cannot get the habit of observation one way or other, you had better give up the being a nurse, for it is not your calling, however kind and anxious you may be.

Surely you can learn at least to judge with the eye how much an oz. of solid food is, how much an oz. of liquid. You will find this helps your observation and memory very much; you will then say to yourself, "A. took about an oz. of his meat to-day;" "B. took three times in 24 hours about ½ pint of beef tea;" instead of saying "B. has taken nothing all day," or "I gave A. his dinner as usual."

I have known several of our real old-fashioned hospital "sisters," who could, as accurately as a measuring glass, measure out all their patients' wine and medicine by the eye, and never be wrong. I do not recommend this; one must be very sure of one's self to do it. I only mention it, because if a nurse can by practice measure medicine by the
eye, surely she is no nurse who cannot measure by the eye about how much food (in oz.) her patient has taken.* In hospitals those who cut up the diets give with quite sufficient accuracy, to each patient, his 12 oz. or his 6 oz. of meat without weighing. Yet a nurse will often have patients loathing all food and incapable of any will to get well, who just tumble over the contents of the plate or dip the spoon in the cup to deceive the nurse, and she will take it away without ever seeing that there is just the same quantity of

* It may be too broad an assertion, and it certainly sounds like a paradox. But I think that in no country are women to be found so deficient in ready and sound observation as in England, while peculiarly capable of being trained to it. The French or Irish woman is too quick of perception to be so sound an observer — the Teuton is too slow to be so ready an observer as the English woman might be. Yet English women lay themselves open to the charge so often made against them by men, viz., that they are not to be trusted in handicrafts to which their strength is quite equal, for want of a practised and steady observation. In countries where women (with average intelligence certainly not superior to that of English women) are employed, e. g., in dispensing, men responsible for what these women do (not theorizing about man’s and woman’s “missions,”) have stated that they preferred the service of women to that of men, as being more exact, more careful, and incurring fewer mistakes of inadvertence.

Now certainly English women are peculiarly capable of attaining to this.

I remember when a child, hearing the story of an accident, related by some one who sent two girls to fetch a “bottle of salvolatile from her room;” “Mary could not stir,” she said, “Fanny ran and fetched a bottle that was not salvolatile, and that was not in my room.”

Now this sort of thing pursues every one through life. A woman is asked to fetch a large new bound red book, lying on the table by the window, and she fetches five small old boarded brown books lying on the shelf by the fire. And this, though she has “put that room to rights” every day for a month perhaps, and must have observed the books every day, lying in the same places, for a month, if she had any observation.

Habitual observation is the more necessary, when any sudden call arises. If “Fanny” had observed “the bottle of salvolatile” in “the aunt’s room,” every day she was there, she would more probably have found it when it was suddenly wanted.

There are two causes for these mistakes of inadvertence. 1. A want of ready attention; only part of the request is heard at all. 2. A want of the habit of observation.

To a nurse I would add, take care that you always put the same things in the same places; you don’t know how suddenly you may be called on some day to find something, and may not be able to remember in your haste where you yourself had put it, if your memory is not in the habit of seeing the thing there always,
food as when she brought it, and she will tell the doctor, too, that the patient has eaten all his diets as usual, when all she ought to have meant is that she has taken away his diets as usual.

Now what kind of a nurse is this.

I would call attention to something else, in which nurses frequently fail in observation. There is a well-marked distinction between the excitable and what I will call the *accumulative* temperament in patients. One will blaze up at once, under any shock or anxiety, and sleep very comfortably after it; another will seem quite calm and even torpid, under the same shock, and people say, "He hardly felt it at all," yet you will find him some time after slowly sinking. The same remark applies to the action of narcotics, of aperients, which, in the one, take effect directly, in the other not perhaps for twenty-four hours. A journey, a visit, an unwonted exertion, will affect the one immediately, but he recovers after it; the other bears it very well at the time, apparently, and dies or is prostrated for life by it. People often say how difficult the excitable temperament is to manage. I say how difficult is the *accumulative* temperament. With the first you have an out-break which you could anticipate, and it is all over. With the second you never know where you are—you never know when the consequences are over. And it requires your closest observation to know what are the consequences of what—for the consequent by no means follows immediately upon the antecedent—and coarse observation is utterly at fault.

Almost all superstitions are owing to bad observation, to the *post hoc, ergo propter hoc*; and bad observers are almost all superstitious. Farmers used to attribute disease among cattle to witchcraft; weddings have been attributed to seeing one magpie, deaths to seeing three; and I have heard the most highly educated now-a-days draw consequences for the sick closely resembling these.

Another remark: although there is unquestionably a physiognomy of disease as well as of health; of all parts of the body, the face is perhaps the one which tells the least to the common observer or the casual visitor. Because, of all parts of the body it is the one most exposed to other influences, besides health. And people never, or scarcely ever, observe enough to know how to distinguish between the effect of exposure, of robust health, of a tender skin of a
tendency to congestion, of suffusion, flushing, or many other things. Again, the face is often the last to show emaciation. I should say that the hand was a much surer test than the face, both as to flesh, color, circulation, &c., &c. It is true that there are some diseases which are only betrayed at all by something in the face, e. g., the eye or the tongue, as great irritability of brain by the appearance of the pupil of the eye. But we are talking of casual, not minute, observation. And few minute observers will hesitate to say that far more untruth than truth is conveyed by the oft repeated words, He looks well, or ill, or better or worse.

Wonderful is the way in which people will go upon the slightest observation, or often upon no observation at all, or upon some saw, which the world's experience, if it had any, would have pronounced utterly false long ago.

I have known patients dying of sheer pain, exhaustion, and want of sleep, from one of the most lingering and painful diseases known, preserve, till within a few days of death, not only the healthy color of the cheek, but the mottled appearance of a robust child. And scores of times have I heard these unfortunate creatures assailed with, "I am glad to see you looking so well." "I see no reason why you should not live till ninety years of age." "Why don't you take a little more exercise and amusement?" with all the other commonplaces with which we are so familiar.

There is, unquestionably, a physiognomy of disease. Let the nurse learn it.

The experienced nurse can always tell that a person has taken a narcotic the night before by the patchiness of the color about the face, when the re-action of depression has set in; that very color which the inexperienced will point to as a proof of health.

There is, again, a faintness which does not betray itself by the color at all, or in which the patient becomes brown instead of white. There is a faintness of another kind which, it is true, can always be seen by the paleness.

But the nurse seldom distinguishes. She will talk to the patient who is too faint to move, without the least scruple, unless he is pale and unless, luckily for him, the muscles of the throat are affected and he loses his voice.

Yet these two faintnesses are perfectly distinguishable, by the mere countenance of the patient.
Again, the nurse must distinguish between the idiosyncrasies of patients. One likes to suffer out all his suffering alone, to be as little looked after as possible. Another likes to be perpetually made much of and pitied, and to have some one always by him. Both these peculiarities might be observed and indulged much more than they are. For quite as often does it happen that a busy attendance is forced upon the first patient, who wishes for nothing but to be "let alone," as that the second is left to think himself neglected.

Again, I think that few things press so heavily on one suffering from long and incurable illness, as the necessity of recording in words from time to time, for the information of the nurse, who will not otherwise see, that he cannot do this or that, which he could do a month or a year ago. What is a nurse there for if she cannot observe these things for herself? Yet I have known—and known too among those—and chiefly among those—whom money and position put in possession of everything which money and position could give—I have known, I say, more accidents, (fatal, slowly or rapidly,) arising from this want of observation among nurses than from almost anything else. Because a patient could get out of a warm-bath alone a month ago—because a patient could walk as far as his bell a week ago, the nurse concludes that he can do so now. She has never observed the change; and the patient is lost from being left in a helpless state of exhaustion, till some one accidentally comes in. And this not from any unexpected apoplectic, paralytic, or fainting fit (though even these could be expected far more, at least, than they are now, if we did but observe). No, from the expected, or to be expected, inevitable, visible, calculable, uninterrupted increase of weakness, which none need fail to observe.

Again, a patient not usually confined to bed, is compelled by an attack of diarrhoea, vomiting, or other accident, to keep his bed for a few days; he gets up for the first time, and the nurse lets him go into another room, without coming in, a few minutes afterwards, to look after him. It never occurs to her that he is quite certain to be faint, or cold, or to want something. She says, as her excuse, Oh, he does not like to be fidgetted after. Yes, he said so some weeks ago; but he never said he did not like to be "fidgetted after," when he is in the state he is in now;
and if he did, you ought to make some excuse to go in to him. More patients have been lost in this way than is at all generally known, viz., from relapses brought on by being left for an hour or two faint, or cold, or hungry, after getting up for the first time.

Yet it appears that scarcely any improvement in the faculty of observing is being made. Vast has been the increase of knowledge in pathology—that science which teaches us the final change produced by disease on the human frame—scarce any in the art of observing the signs of the change while in progress. Or, rather, is it not to be feared that observation, as an essential part of medicine, has been declining?

Which of us has not heard fifty times, from one or another, a nurse, or a friend of the sick, aye, and a medical friend too, the following remark:—"So A is worse, or B is dead. I saw him the day before; I thought him so much better; there certainly was no appearance from which one could have expected so sudden (?) a change." I have never heard any one say, though one would think it the more natural thing, "There must have been some appearance, which I should have seen if I had but looked; let me try and remember what there was, that I may observe another time." No, this is not what people say. They boldly assert that there was nothing to observe, not that their observation was at fault.

Let people who have to observe sickness and death look back and try to register in their observation the appearances which have preceded relapse, attack, or death, and not assert that there were none, or that there were not the right ones.*

A want of the habit of observing conditions and an in-

* It falls to few ever to have had the opportunity of observing the different aspects which the human face puts on at the sudden approach of certain forms of death by violence; and as it is a knowledge of little use, I only mention it here as being the most startling example of what I mean. In the nervous temperament the face becomes pale (this is the only recognized effect); in the sanguine temperament purple; in the bilious yellow, or every manner of color in patches. Now, it is generally supposed that paleness is the one indication of almost any violent change in the human being, whether from terror, disease, or anything else. There can be no more false observation. Granted, it is the one recognized livery, as I have said—de rigueur in novels, but nowhere else.
veterate habit of taking averages are each of them often equally misleading.

Men whose profession like that of medical men leads them to observe only, or chiefly, palpable and permanent organic changes are often just as wrong in their opinion of the result as those who do not observe at all. For instance, there is a broken leg; the surgeon has only to look at it once to know; it will not be different if he sees it in the morning to what it would have been had he seen it in the evening. And in whatever conditions the patient is, or is likely to be, there will still be the broken leg, until it is set. The same with many organic diseases. An experienced physician has but to feel the pulse once, and he knows that there is aneurism which will kill some time or other.

But with the great majority of cases, there is nothing of the kind; and the power of forming any correct opinion as to the result must entirely depend upon an inquiry into all the conditions in which the patient lives. In a complicated state of society in large towns, death, as every one of great experience knows, is far less often produced by any one organic disease than by some illness, after many other diseases, producing just the sum of exhaustion necessary for death. There is nothing so absurd, nothing so misleading as the verdict one so often hears: So-and-so has no organic disease,—there is no reason why he should not live to extreme old age; sometimes the clause is added, sometimes not: Provided he has quiet, good food, good air, &c., &c., &c.; the verdict is repeated by ignorant people without the latter clause; or there is no possibility of the conditions of the latter clause being obtained; and this, the only essential part of the whole, is made of no effect. I have heard a physician, deservedly eminent, assure the friends of a patient of his recovery. Why? Because he had now prescribed a course, every detail of which the patient had followed for years. And because he had forbidden a course which the patient could not by any possibility alter.*

* I have known two cases, the one of a man who intentionally and repeatedly displaced a dislocation, and was kept and petted by all the surgeons; the other of one who was pronounced to have nothing the matter with him, there being no organic change perceptible, but who died within the week. In both these cases, it was the nurse who, by accurately pointing out what she had accurately observed, to the doc-
Undoubtedly a person of no scientific knowledge whatever but of observation and experience in these kinds of conditions, will be able to arrive at a much truer guess as

tors, saved the one case from persevering in a fraud, the other from being discharged when actually in a dying state.

I will even go further and say, that in diseases which have their origin in the feeble or irregular action of some function, and not in organic change, it is quite an accident if the doctor who sees the case only once a day, and generally at the same time, can form any but a negative idea of its real condition. In the middle of the day, when such a patient has been refreshed by light and air, by his tea, his beef-tea, and his brandy, by hot bottles to his feet, by being washed and by clean linen, you can scarcely believe that he is the same person as lay with a rapid fluttering pulse, with puffed eye-lids, with short breath, cold limbs, and unsteady hands, this morning. Now what is a nurse to do in such a case? Not cry, "Lord, bless you, sir, why you’d have thought he were a dying all night." This may be true, but it is not the way to impress with the truth a doctor more capable of forming a judgment from the facts, if he did but know them, than you are. What he wants is not your opinion, however respectfully given, but your facts. In all diseases it is important, but in diseases which do not run a distinct and fixed course, it is not only important, it is essential that the facts the nurse alone can observe, should be accurately observed, and accurately reported to the doctor.

I must direct the nurse’s attention to the extreme variation there is not unfrequently in the pulse of such patients during the day. A very common case is this: Between 3 and 4 A. M., the pulse becomes quick, perhaps 130, and so thready it is not like a pulse at all, but like a string vibrating just underneath the skin. After this the patient gets no more sleep. About mid-day the pulse has come down to 80; and though feeble and compressible, is a very respectable pulse. At night, if the patient has had a day of excitement, it is almost imperceptible. But, if the patient has had a good day, it is stronger and steadier, and not quicker than at mid-day. This is a common history of a common pulse; and others, equally varying during the day, might be given. Now, in inflammation, which may almost always be detected by the pulse, in typhoid fever, which is accompanied by the low pulse that nothing will raise, there is no such great variation. And doctors and nurses become accustomed not to look for it. The doctor indeed cannot. But the variation is in itself an important feature.

Cases like the above often "go off rather suddenly," as it is called, from some trifling ailment of a few days, which just makes up the sum of exhaustion necessary to produce death. And everybody cries, Who would have thought it? except the observing nurse, if there is one, who had always expected the exhaustion to come, from which there would be no rally, because she knew the patient had no capital in strength on which to draw, if he failed for a few days to make his barely daily income in sleep and nutrition.

I have often seen really good nurses distressed, because they could not impress the doctor with the real danger of their patient; and quite provoked because the patient "would look" either "so much better"
to the probable duration of life of members of a family or inmates of a house, than the most scientific physician to whom the same persons are brought to have their pulse felt; no inquiry being made into their conditions.

In Life Insurance and such like societies, were they instead of having the person examined by a medical man, to have the houses, conditions, ways of life, of these persons examined, at how much truer results would they arrive! W. Smith appears a fine hale man, but it might be known that the next cholera epidemic he runs a bad chance. Mr. and Mrs. J. are a strong healthy couple, but it might be known that they live in such a house, in such part of London, so near the river that they will kill four-fifths of their children; which of the children will be the ones to survive might also be known.

Averages again seduce us away from minute observation. "Average mortalities" merely tell that so many per cent. die in this town and so many in that, per annum. But whether A or B will be among these, the "average rate" of course does not tell. We know, say, that from 22 to 24 per 1,000 will die in London next year. But minute inquiries into conditions enable us to know that in such a district, nay, in such a street,—or even on one side of that street, in such a particular house, or even on one floor of that particular house, will be the excess of mortality, that is, the person will die who ought not to have died before old age.

Now, would it not very materially alter the opinion of whoever were endeavoring to form one, if he knew that from that floor, of that house, of that street the man came.

Much more precise might be our observations even than this, and much more correct our conclusions.

It is well known that the same names may be seen constantly recurring on workhouse books for generations. That is, the persons were born and brought up, and will be born and brought up, generation after generation, in the condi-

or "so much worse" than he really is "when the doctor was there." The distress is very legitimate, but it generally arises from the nurse not having the power of laying clearly and shortly before the doctor the facts from which she derives her opinion, or from the doctor being hasty and inexperienced, and not capable of eliciting them. A man who really cares for his patients, will soon learn to ask for and appreciate the information of a nurse, who is at once a careful observer and a clear reporter.
tions which make paupers. Death and disease are like the workhouse, they take from the same family, the same house, or in other words, the same conditions. Why will we not observe what they are?

The close observer may safely predict that such a family, whether its members marry or not, will become extinct; that such another will degenerate morally and physically. But who learns the lesson? On the contrary, it may be well known that the children die in such a house at the rate of 8 out of 10; one would think that nothing more need be said; for how could Providence speak more distinctly? yet nobody listens, the family goes on living there till it dies out, and then some other family takes it. Neither would they listen "if one rose from the dead."

In dwelling upon the vital importance of sound observation, it must never be lost sight of what observation is for. It is not for the sake of piling up miscellaneous information or curious facts, but for the sake of saving life and increasing health and comfort. The caution may seem useless, but it is quite surprising how many men (some women do it too), practically behave as if the scientific end were the only one in view, or as if the sick body were but a reservoir for stowing medicines into, and the surgical disease only a curious case the sufferer has made for the attendant’s special information. This is really no exaggeration. You think, if you suspected your patient was being poisoned, say, by a copper kettle, you would instantly, as you ought, cut off all possible connection between him and the suspected source of injury, without regard to the fact that a curious mine of observation is thereby lost. But it is not everybody who does so, and it has actually been made a question of medical ethics, what should the medical man do if he suspected poisoning? The answer seems a very simple one,—insist on a confidential nurse being placed with the patient, or give up the case.

And remember every nurse should be one who is to be depended upon, in other words, capable of being a "confidential" nurse. She does not know how soon she may find herself placed in such a situation; she must be no gossip, no vain talker; she should never answer questions about her sick except to those who have a right to ask them; she must, I need not say, be strictly sober and hon-
CONCLUSION.

est; but more than this, she must be a religious and devoted woman; she must have a respect for her own calling, because God's precious gift of life is often literally placed in her hands; she must be a sound, and close, and quick observer; and she must be a woman of delicate and decent feeling.

To return to the question of what observation is for:—It would really seem as if some had considered it as its own end, as if detection, not cure, was their business; nay more, in a recent celebrated trial, three medical men, according to their own account, suspected poison, prescribed for dysentery, and left the patient to the poisoner. This is an extreme case. But in a small way, the same manner of acting falls under the cognizance of us all. How often the attendants of a case have stated that they knew perfectly well that the patient could not get well in such an air, in such a room, or under such circumstances, yet have gone on dosing him with medicine, and making no effort to remove the poison from him, or him from the poison which they knew was killing him; nay, more, have sometimes not so much as mentioned their conviction in the right quarter—that is, to the only person who could act in the matter.

CONCLUSION.

The whole of the preceding remarks apply even more to children and to puerperal women than to patients in general. They also apply to the nursing of surgical, quite as much as to that of medical cases. Indeed, if it be possible, cases of external injury require such care even more than sick. In surgical wards, one duty of every nurse certainly is prevention. Fever, or hospital gangrene, or pyæmia, or purulent discharge of some kind may else supervene. Has she a case of compound fracture, of amputation, or of erysipelas, it may depend very much on how she looks upon the things enumerated in these notes, whether one or other of these hospital diseases attacks her patient or not. If she allows her ward to become filled with the peculiar close fetid smell, so apt to be produced among surgical cases, especially where there is great suppuration and discharge, she may see a vigorous patient in the prime of life gradually sink and die where, according
to all human probability, he ought to have recovered. The surgical nurse must be ever on the watch, ever on her guard, against want of cleanliness, foul air, want of light, and of warmth.

Nevertheless let no one think that because sanitary nursing is the subject of these notes, therefore, what may be called the handicraft of nursing is to be undervalued. A patient may be left to bleed to death in a sanitary palace. Another who cannot move himself may die of bed-sores, because the nurse does not know how to change and clean him, while he has every requisite of air, light, and quiet. But nursing, as a handicraft, has not been treated of here for three reasons: 1. That these notes do not pretend to be a manual for nursing, any more than for cooking for the sick; 2. That the writer, who has herself seen more of what may be called surgical nursing, i.e. practical manual nursing, than, perhaps, any one in Europe, honestly believes that it is impossible to learn it from any book, and that it can only be thoroughly learnt in the wards of a hospital; and she also honestly believes that the perfection of surgical nursing may be seen practised by the old-fashioned "Sister" of a London hospital, as it can be seen nowhere else in Europe. 3. While thousands die of foul air, &c., who have this surgical nursing to perfection, the converse is comparatively rare.

To revert to children. They are much more susceptible than grown people to all noxious influences. They are affected by the same things, but much more quickly and seriously, viz., by want of fresh air, of proper warmth, want of cleanliness in house, clothes, bedding, or body, by startling noises, improper food, or want of punctuality, by dulness and by want of light, by too much or too little covering in bed, or when up, by want of the spirit of management generally in those in charge of them. One can, therefore, only press the importance, as being yet greater in the case of children, greatest in the case of sick children, of attending to these things.

That which, however, above all, is known to injure children seriously is foul air, and most seriously at night. Keeping the rooms where they sleep tight shut up, is destruction to them. And, if the child's breathing be disordered by disease, a few hours only of such foul air may endanger its life, even where no inconvenience is felt by grown-up persons in the same room.
The following passages, taken out of an excellent "Lecture on Sudden Death in Infancy and Childhood," just published, show the vital importance of careful nursing of children. "In the great majority of instances, when death suddenly befalls the infant or young child, it is an accidental; it is not a necessary, inevitable result of any disease from which it is suffering."

It may be here added, that it would be very desirable to know how often death is, with adults, "not a necessary, inevitable result of any disease." Omit the word "sudden;" (for sudden death is comparatively rare in middle age;) and the sentence is almost equally true for all ages.

The following causes of "accidental" death in sick children are enumerated:—"Sudden noises, which startle—a rapid change of temperature, which chills the surface, though only for a moment—a rude awakening from sleep—or even an over-hasty, or an over-full meal"—"any sudden impression on the nervous system—any hasty alteration of posture—in short, any cause whatever by which the respiratory process may be disturbed."

It may again be added, that, with very weak adult patients, these cases are also (not often "suddenly fatal," it is true, but) very much oftener than is at all generally known, irreparable in their consequences.

Both for children and for adults, both for sick and for well (although more certainly in the case of sick children than in any others), I would here again repeat, the most frequent and most fatal cause of all is sleeping, for even a few hours, much more for weeks and months, in foul air, a condition which, more than any other condition, disturbs the respiratory process, and tends to produce "accidental" death in disease

I need hardly here repeat the warning against any confusion of ideas between cold and fresh air. You may chill a patient fatally without giving him fresh air at all. And you can quite well, nay, much better, give him fresh air without chilling him. This is the test of a good nurse.

In cases of long recurring faintnesses from disease, for instance, especially disease which affects the organs of breathing, fresh air to the lungs, warmth to the surface, and often (as soon as the patient can swallow) hot drink, these are the right remedies and the only ones. Yet, oftener than not, you see the nurse or mother just reversing
this; shutting up every cranny through which fresh air can enter, and leaving the body cold, or perhaps throwing a greater weight of clothes upon it, when already it is generating too little heat.

"Breathing carefully, anxiously, as though respiration were a function which required all the attention for its performance," is cited as a not unusual state in children, and as one calling for care in all the things enumerated above. That breathing becomes an almost voluntary act, even in grown up patients who are very weak, must often have been remarked.

"Disease having interfered with the perfect accomplishment of the respiratory function, some sudden demand for its complete exercise, issues in the sudden stand-still of the whole machinery," is given as one process: — "life goes out for want of nervous power to keep the vital functions in activity," is given as another, by which "accidental" death is most often brought to pass in infancy.

Also in middle age, both these processes may be seen ending in death, although generally not suddenly. And I have seen, even in middle age, the "sudden stand-still" here mentioned, and from the same causes.

To sum up: — the answer to two of the commonest objections urged, one by women themselves, the other by men, against the desirableness of sanitary knowledge for women, plus a caution, comprises the whole argument for the art of nursing.

(1.) It is often said by men, that it is unwise to teach women anything about these laws of health, because they will take to physicking,— that there is a great deal too much of amateur physicking as it is, which is indeed true. One eminent physician told me that he had known more calomel given, both at a pinch and for a continuance, by mothers, governesses, and nurses, to children than he had ever heard of a physician prescribing in all his experience. Another says, that women's only idea in medicine is calomel and aperients. This is undeniably too often the case. There is nothing ever seen in any professional practice like the reckless physicking by amateur females.* But this is

* I have known many ladies who, having once obtained a "blue pill" prescription from a physician, gave and took it as a common aperient two or three times a week — with what effect may be supposed.
CONCLUSION.

just what the really experienced and deserving nurse does not do; she neither physics herself nor others. And to cultivate in things pertaining to health, observation and experience in women who are mothers, governesses or nurses, is just the way to do away with amateur physicking, and if the doctors did but know it, to make the nurses obedient to them,—helps to them instead of hindrances. Such education in women would indeed diminish the doctor's work—but no one really believes that doctors wish

In one case I happened to be the person to inform the physician of it, who substituted for the prescription a comparatively harmless aperient pill. The lady came to me and complained that it "did not suit her half so well."

If women will take or give physic, by far the safest plan is to send for "the doctor" every time—for I have known ladies who both gave and took physic, who would not take the pains to learn the names of the commonest medicines, and confounded, e. g., colocynth with colchicum. This is playing with sharp-edged tools "with a vengeance."

There are excellent women who will write to London to their physician that there is much sickness in their neighborhood in the country, and ask for some prescription from him which they used to like themselves, and then give it to all their friends and to all their poorer neighbors who will take it. Now, instead of giving medicine, of which you cannot possibly know the exact and proper application, nor all its consequences, would it not be better if you were to persuade and help your poorer neighbors to remove the dung-hill from before the door, to put in a window which opens, or an Arnott's ventilator, or to cleanse and limewash the cottages? Of these things the benefits are sure. The benefits of the inexperienced administration of medicines are by no means so sure.

Homœopathy has introduced one essential amelioration in the practice of physic by amateur females; for its rules are excellent, its physicking comparatively harmless—the "globule" is the one grain of folly which appears to be necessary to make any good thing acceptable. Let then women, if they will give medicine, give homœopathic medicine. It won't do any harm.

An almost universal error among women is the supposition that everybody must have the bowels opened once in every twenty-four hours, or must fly immediately to aperients. The reverse is the conclusion of experience.

This is a doctor's subject, and I will not enter more into it; but will simply repeat, do not go on taking or giving to your children your abominable "courses of aperients," without calling in the doctor.

It is very seldom indeed, that by choosing your diet, you cannot regulate your own bowels; and every woman may watch herself to know what kind of diet will do this; I have known deficiency of meat produce constipation, quite as often as deficiency of vegetables; baker's bread much oftener than either. Home made brown bread will oftener cure it than anything else.
that there should be more illness, in order to have more work.

(2.) It is often said by women, that they cannot know anything of the laws of health, or what to do to preserve their children's health, because they can know nothing of "Pathology," or cannot "dissect,"—a confusion of ideas which it is hard to attempt to disentangle. Pathology teaches the harm that disease has done. But it teaches nothing more. We know nothing of the principle of health, the positive of which pathology is the negative, except from observation and experience. And nothing but observation and experience will teach us the ways to maintain or to bring back the state of health. It is often thought that medicine is the curative process. It is no such thing; medicine is the surgery of functions, as surgery proper is that of limbs and organs. Neither can do anything but remove obstructions; neither can cure; nature alone cures. Surgery removes the bullet out of the limb, which is an obstruction to cure, but nature heals the wound. So it is with medicine; the function of an organ becomes obstructed; medicine, so far as we know, assists nature to remove the obstruction, but does nothing more. And what nursing has to do in either case, is to put the patient in the best condition for nature to act upon him. Generally, just the contrary is done. You think fresh air, and quiet and cleanliness extravagant, perhaps dangerous, luxuries, which should be given to the patient only when quite convenient, and medicine the sine qua non, the panacea. If I have succeeded in any measure in dispelling this illusion, and in showing what true nursing is, and what it is not, my object will have been answered.

Now for the caution:—

(3.) It seems a commonly received idea among men and even among women themselves that it requires nothing but a disappointment in love, the want of an object, a general disgust, or incapacity for other things, to turn a woman into a good nurse.

This reminds one of the parish where a stupid old man was set to be schoolmaster because he was "past keeping the pigs."

Apply the above receipt for making a good nurse to making a good servant. And the receipt will be found to fail.
Yet popular novelists of recent days have invented ladies disappointed in love or fresh out of the drawing-room turning into the war-hospitals to find their wounded lovers, and when found, forthwith abandoning their sick-ward for their lover as might be expected. Yet in the estimation of the authors, these ladies were none the worse for that, but, on the contrary, were heroines of nursing.

What cruel mistakes are sometimes made by benevolent men and women in matters of business about which they can know nothing and think they know a great deal.

The everyday management of a large ward— the knowing what are the laws of life and death for men, and what the laws of health for wards—(and wards are healthy or unhealthy, mainly according to the knowledge or ignorance of the nurse)—are not these matters of sufficient importance and difficulty to require learning by experience and careful inquiry, just as much as any other art? They do not come by inspiration to the lady disappointed in love, nor to the poor workhouse drudgery hard up for a livelihood.

And terrible is the injury which has followed to the sick from such wild notions!

In this respect (and why is it so?), in Roman Catholic countries, both writers and workers are, in theory at least, far before ours. They would never think of such a beginning for a good working Superior or Sister of Charity. And many a Superior has refused to admit a Postulant who appeared to have no better "vocation" or reasons for offering herself than these.

It is true we make "no vows." But is a "vow" necessary to convince us that the true spirit for learning any art, most especially an art of charity, aught, is not a disgust to everything or something else? Do we really place the love of our kind (and of nursing, as one branch of it) so low as this? What would the Mère Angélique of Port Royal, what would our own Mrs. Fry have said to this?

Note.—I would earnestly ask my sisters to keep clear of both the jargons now current everywhere (for they are equally jargons); of the jargon, namely, about the "rights" of women, which urges women to do all that men do, including the medical and other professions, merely because men do it, and without regard to whether this is the best that
women can do; and of the jargon which urges women to do nothing that men do, merely because they are women, and should be "recalled to a sense of their duty as women," and because "this is women's work," and "that is men's," and "these are things which women should not do," which is all assertion, and nothing more. Surely woman should bring the best she has, *whatever* that is, to the work of God's world, without attending to either of these cries. For what are they, both of them, the one *just* as much as the other, but listening to the "what people will say," to opinion, to the "voices from without?" And as a wise man has said, no one has ever done anything great or useful by listening to the voices from without.

You do not want the effect of your good things to be, "How wonderful for a woman!" nor would you be deterred from good things by hearing it said, "Yes, but she ought not to have done this, because it is not suitable for a woman." But you want to do the thing that is good, whether it is "suitable for a woman" or not.

It does not make a thing good, that it is remarkable that a woman should have been able to do it. Neither does it make a thing bad, which would have been good had a man done it, that it has been done by a woman.

Oh, leave these jargons, and go your way straight to God's work, in simplicity and singleness of heart.
NOTE AS TO THE NUMBER OF WOMEN EMPLOYED AS NURSES IN GREAT BRITAIN.

25,466 were returned, at the census of 1851, as nurses by profession, 39,139 nurses in domestic service, * and 2,822 midwives. The numbers of different ages are shown in table A, and in table B their distribution over Great Britain.

To increase the efficiency of this class, and to make as many of them as possible the disciples of the true doctrines of health, would be a great national work.

For there the material exists, and will be used for nursing, whether the real "conclusion of the matter" be to nurse or poison the sick. A man, who stands perhaps at the head of our medical profession, once said to me, "I send a nurse into a private family to nurse the sick, but I know that is only to do them harm."

Now a nurse means any person in charge of the personal health of another. And, in the preceding notes, the term nurse is used indiscriminately for amateur and professional nurses. For, besides nurses of the sick and nurses of children, the numbers of whom are here given, there are friends or relations who take temporary charge of a sick person, there are mothers of families. It appears as if these unprofessional nurses were just as much in want of knowledge of the laws of health as professional ones.

Then there are the schoolmistresses of all national and other schools throughout the kingdom. How many of children's epidemics originate in these! Then the proportion of girls in these schools who become mothers or members among the 61,600 nurses recorded above, or schoolmistresses in their turn. If the laws of health, as far as regards fresh air, cleanliness, light, &c., were taught to these, would this not prevent some children being killed, some evil being perpetuated? On women we must depend, first and last, for personal and household hygiene—for preventing the race from degenerating in as far as these things are concerned. Would not the true way of infusing the art of preserving its own health into the human race be to teach the female part of it in schools and hospitals, both by practical teaching and by simple experiments, in as far as these illustrate what may be called the theory of it.

* A curious fact will be shown by Table A; viz., that 18,122 out of 39,399, or nearly one half of all the nurses in domestic service, are between 5 and 20 years of age.
